# Fixed capital flows and stocks

1972-1979

# Flux et stocks de capital fixe

1972-1979

## Note

This and other government publications may be purchased from local authorized agents and other community bookstores or by mail order.

Mail orders should be sent to Publications Distribution, Statistics Canada, Ottawa, K1A 0T6, or to Publishing Centre, Supply and Services Canada, Ottawa, K1A 0S9.

Inquiries about this publication should be addressed to:

National Wealth and Capital Stock Section,  
Construction Division,

Statistics Canada, Ottawa, K1A 0T6 (telephone: 995-8152) or to a local office of the bureau's User Advisory Services Division:

St. John's (Nfld.)	(726-0713)
Halifax	(426-5331)
Montréal	(283-5725)
Ottawa	(992-4734)
Toronto	(966-6586)
Winnipeg	(949-4020)
Regina	(569-5405)
Edmonton	(425-5052)
Vancouver	(666-3695)

Toll-free access to the regional statistical information service is provided in Nova Scotia, New Brunswick, and Prince Edward Island by telephoning 1-800-565-7192. Throughout Saskatchewan, the Regina office can be reached by dialing 1-800-667-3524, and throughout Alberta, the Edmonton office can be reached by dialing 1-800-222-6400.

## Nota

On peut se procurer cette publication, ainsi que toutes les publications du gouvernement du Canada, auprès des agents autorisés locaux, dans les librairies ordinaires ou par la poste.

Les commandes par la poste devront parvenir à Distribution des publications, Statistique Canada, Ottawa, K1A 0T6, ou à Imprimerie et édition, Approvisionnement et services Canada, Ottawa, K1A 0S9.

Toutes demandes de renseignements sur la présente publication doivent être adressées à:

Section de la richesse nationale et des stocks de capital,  
Division de la construction,

Statistique Canada, Ottawa, K1A 0T6 (téléphone: 995-8152) ou à un bureau local de la Division de l'assistance-utilisateurs situé aux endroits suivants:

St. John's (T. - N.)	(726-0713)
Halifax	(426-5331)
Montréal	(283-5725)
Ottawa	(992-4734)
Toronto	(966-6586)
Winnipeg	(949-4020)
Regina	(569-5405)
Edmonton	(425-5052)
Vancouver	(666-3695)

On peut obtenir une communication gratuite avec le service régional d'information statistique de la Nouvelle-Écosse, du Nouveau-Brunswick et de l'Île-du-Prince-Édouard en composant 1-800-565-7192. En Saskatchewan, on peut communiquer avec le bureau régional de Regina en composant 1-800-667-3524, et en Alberta, avec le bureau d'Edmonton au numéro 1-800-222-6400.

FIXED CAPITAL FLOWS AND STOCKS

---

FLUX ET STOCKS DE CAPITAL FIXE

1972-1979

The present volume updates Catalogue 13-568. The investment data have been revised from 1977 on, and the price indexes incorporate revisions from 1972 on.

L'édition présente est une mise à jour du n° 13-568 au catalogue. Les données d'investissement ont été révisées de 1977 et les indices des prix incorporent des révisions de 1972.

## Symbols

The following standard symbols are used in Statistics Canada publications:

- . . figures not available.
- . . . figures not appropriate or not applicable.
  - nil or zero.
  - amount too small to be expressed.
- P preliminary figures.
- † revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.

### NOTE ON CANSIM

Data in this publication were retrieved from CANSIM (Canadian Socio-economic Information Management System) and are available to the public, via terminal, on computer printout or in machine readable form. For further information, please refer to Text Table III.

## Signes conventionnels

Les signes conventionnels suivants sont employés uniformément dans les publications de Statistique Canada:

- . . nombres indisponibles.
- . . . n'ayant pas lieu de figurer.
  - néant ou zéro.
  - nombres infimes.
- P nombres provisoires.
- † nombres rectifiés.
- x confidentiel en vertu des dispositions de la Loi sur la statistique relatives au secret.

### NOTE CONCERNANT CANSIM

Les données de la présente publication sont extraites de CANSIM (système canadien d'information socio-économique) et sont disponibles au public, par voie de terminal, sur imprimés mécanographiques ou sous une forme assimilable par machine. Pour de plus amples renseignements, veuillez vous reporter au tableau explicatif III.

## Introduction

The procedures and problems associated with the estimates of capital stocks are fully described in Catalogue 13-522. The purpose of this introduction is to present a brief outline of the basic methodology underlying the capital flow and stock data presented in this report.

Capital stocks in existence have traditionally been considered one among several factors of production. The measurement of capital in both theoretical and technical formulations is closely related to investment to the extent that a certain technical link between the two concepts and definitions (stocks, flows) has to be established before any elaboration can be made in the direction of capital measurement.

Traditionally the relationship between the capital stock and the corresponding flow of capital services has been one of proportionality. This assumption implies that the services of capital goods acquired at different points in time are perfect substitutes in production. From this substitutability over time stems the property of proportionality between the capital services from each capital good and the stock of capital as measured by adding together all past investment acquisitions.

There is a substantial literature, both theoretical and technical, relating to the measurement of capital. Among a number of methods the "Perpetual Inventory" method is generally preferred primarily because of its malleability in the creation of time series of capital stocks.

Briefly, this method involves the accumulation over a period of years of investment expenditures by industry to obtain its capital stock in any given year.

The basic ingredients required are:

annual investment series by industry and category of expenditure;

price deflators relating to the investment series;

estimates of average economic lives of the assets used in the various industries.

The reliability of the capital stocks series thus generated depends of course on the quality of the investment data being cumulated, on the realism of

## Introduction

Les méthodes et problèmes associés aux estimations des stocks de capital sont décrits au complet dans le n° 13-522 au catalogue. La présente introduction vise à décrire brièvement la méthodologie à la base des données sur les stocks et flux de capital présentées dans la présente publication.

Les stocks de capital existants ont toujours été considérés comme l'un des facteurs de production. La mesure du capital tant du point de vue théorique que pratique est étroitement liée aux investissements, dans la mesure où il faut établir un certain lien technique entre les deux concepts et définitions (stocks, flux) avant de pouvoir progresser dans la mesure du capital.

La relation entre le stock de capital et le flux correspondant de services de nature capitale a toujours été une relation de proportionnalité. Ce postulat implique que les services des biens de capital acquis à différents moments sont des substituts parfaits dans la production. De cette notion de possibilité de substitution dans le temps découle celle de proportionnalité entre les services de nature capitale provenant de chaque bien de capital et le stock de capital, mesuré par la somme de toutes les acquisitions faites grâce aux investissements.

Un nombre appréciable d'auteurs se sont penchés sur la mesure du capital à la fois du point de vue théorique et du point de vue pratique. Parmi les diverses méthodes existantes, on préfère généralement celle de "L'inventaire perpétuel" avant tout pour sa souplesse lors de la création de séries chronologiques de stocks de capital.

En bref, il s'agit d'accumuler pendant un certain nombre d'années les dépenses d'investissements de l'industrie pour obtenir son stock de capital pour une année donnée.

Les éléments fondamentaux nécessaires sont:

les séries annuelles des investissements, par industrie et catégorie de dépense;

les indices de déflation se rapportant aux séries sur les investissements;

les estimations de la durée de vie économique moyenne des actifs utilisés par les diverses industries.

La fiabilité des séries de stock de capital ainsi produites dépend naturellement de la qualité des données sur les investissements qui ont été réunies, du réalisme à la fois

both the service life assumption and the method by which capital assets are considered to depreciate over their service life.

As an aid to a better understanding of the mechanics of the "Perpetual Inventory" method an illustration of the actual computing process is given. Assume that the capital assets in a particular industry remain in production 10 years before they are needed.

Investment expenditures pertaining to the types of capital assets in question, adjusted for prices, are cumulated for a period of ten years. In the tenth year a measure of the gross stock of this industry's capital asset is obtained. In the eleventh year the investment expenditures of the first year are deducted from the cumulated total while the purchases of capital assets of the new year are added. We proceed in the same manner for all subsequent years.

In the **gross capital stocks** capital assets are included at their full value during the entire time they remain in the capital stock. In other words, the deductions from gross investment are due to the fact that assets in question have ceased to exist. An alternative set of measures of capital stocks is derived by adjusting the value of the assets in existence for the wear and tear and obsolescence they undergo during their service life; these estimates are known as **net capital stocks**. Calculations of net capital stocks are made by applying a depreciation formula to the gross stock estimates. The **net stocks** presented in this report have been prepared by means of using the "straight-line" method. The net stock is always equal to the difference between the cumulative value of past gross investment and cumulative depreciation. Text Table I summarizes an exemplary illustration of the computational procedure involved in the "Perpetual Inventory" method. Text Table II shows the industries for which capital flow and stock estimates are presented in this volume together with the types of assets and their service lives.

In the context of the "Perpetual Inventory" method the value of the capital stock can also be viewed as the weighted sum of past gross investment expenditures. The weights used can be thought of as the resultant of two factors. The first factor relates to the mortality of an asset, namely the probability that the assets of a certain age are in existence when the stock is being estimated. In other words this factor relates to the depreciation in the sense of physical decay, retirement, etc.

The second factor deals with the value of the assets still present in the stock. If the items included in the stock retain their original value then of course we are measuring the gross stock; if their value is diminishing over their service life then we are measuring the net stocks where allowances have been made for wear and tear and obsolescence.

de l'hypothèse de durée de vie et de la méthode que l'on a retenue pour la dépréciation des actifs de nature capitale tout au long de leur vie utile.

Afin de mieux faire saisir le mécanisme de la méthode de "L'inventaire perpétuel", le lecteur trouvera ci-après une illustration du processus réel de calcul. Supposons que les actifs de nature capitale d'une industrie donnée demeurent en production 10 ans avant d'être retirés.

Les dépenses d'investissement se rapportant aux catégories d'actifs de capital considérées, après déflation, sont sommées sur une période de dix ans. La dixième année, on obtient une mesure du stock brut des actifs de capital de cette industrie. La onzième année, on déduit les dépenses d'investissement de la première année du total cumulatif, et on ajoute les achats de nature capitale au cours de la nouvelle année. On procède ainsi de la même manière pour toutes les années suivantes.

On regroupe dans les **stocks bruts de capital** les actifs de nature capitale à leur valeur intégrale tant que ces actifs font partie du stock de capital. En d'autres termes, les déductions sur les investissements bruts s'expliquent par le fait que les actifs en question ont cessé d'exister. On obtient un autre ensemble de mesures des stocks de capital en ajustant la valeur des actifs existants pour prendre en compte l'usure et l'obsolescence qu'ils subissent lors de leur durée de vie, et l'on appelle ces estimations **stocks nets de capital**. On calcule les stocks nets de capital grâce à une formule d'amortissement que l'on fait intervenir dans les estimations des stocks bruts. Les **stocks nets** indiqués dans la présente publication ont été calculés grâce à la méthode dite "linéaire". Le stock net est toujours égal à la différence entre la valeur cumulative des investissements bruts antérieurs et la dépréciation accumulée. On trouvera au tableau explicatif I un exemple récapitulatif de la méthode de calcul utilisée dans la méthode de "L'inventaire perpétuel". Le tableau explicatif II présente les industries dont les estimations des flux et stocks de capital figurent dans le présent ouvrage, ainsi que les différentes catégories d'actifs et leurs durées de vie.

Dans le cadre de la méthode de "L'inventaire perpétuel", on peut aussi considérer la valeur du stock de capital comme la somme pondérée des dépenses d'investissement brutes antérieures. Les coefficients de pondération utilisés peuvent être considérés comme le résultat de deux facteurs. Le premier de ces facteurs se rapporte à la disparition d'un actif, c'est-à-dire à la probabilité que les actifs d'un certain âge existent encore lors de l'estimation du stock. En d'autres termes, ce facteur se rapporte à la dépréciation, dans le sens de dégradation physique, de retrait, etc.

Le second facteur a trait à la valeur des actifs faisant encore partie du stock. Si les éléments du stock conservent leur valeur originale, naturellement nous mesurons alors le stock brut; si leur valeur diminue tout au long de leur durée de vie, nous mesurons alors les stocks nets, après avoir pris en compte l'usure et l'obsolescence.

We can summarize the nature of the calculations involved in measuring the stock of capital in the following fashion:

$$1. \text{ Gross stock at the end of period} = \sum_{i=1}^L W_i I_{it}$$

where  $L$  = the assumed economic life of the capital asset,  $W_i = 1$  during the lifetime of the asset and  $I_{it}$  = the investment expenditures during each period. This assumption about the weight ( $W_i = 1$ ) is only one among many possibilities such as a distribution of weights derived from studies of the "survival curves" of individual pieces of equipment.

2. Net stock at the end of the period

$$= \sum_{i=1}^L W_i I_{it} d_i$$

where  $L$ ,  $W_i$  and  $I_{it}$  as before and

$$d_i = 1 - \frac{1}{L} T \quad (T = 0, 1, \dots, L - 1)$$

which indicates that the value of the asset declines linearly. Again this assumption is one among many alternatives. In recent years the diminishing balance system of depreciation has become increasingly popular.

It should be noted that the above stocks relate to the end of each calendar year and some minor adjustments are necessary to centre the estimates of the middle of each calendar year.

As mentioned before for certain industries alternative measures are available where alternative assumptions such as a bell-shaped distribution of weights and different depreciation functions have been used. It is hoped that in the near future a separate publication dealing with these alternative measures will become available.

## Brief Explanation of Terms

**Constant valuation** measures values in constant prices (1971).

**Current valuation** measures values in the prices of the given year.

**Depreciation** (capital consumption allowance) is the allowance made for physical deterioration and obsolescence.

**Discards** (retirements) are the value of gross investment that is withdrawn from the stock.

Nous pouvons résumer ainsi la nature des calculs entraînés par la mesure du stock de capital:

$$1. \text{ Le stock brut en fin de période est } = \sum_{i=1}^L W_i I_{it}$$

où  $L$  est la durée de vie présumée de l'actif, et  $I_{it}$  sont les dépenses d'investissement au cours de chaque période. L'hypothèse relative au coefficient de pondération ( $W_i = 1$ ) n'est qu'une des nombreuses possibilités, comme par exemple une distribution des coefficients de pondération obtenue à partir d'études des "courbes de survie" des différents éléments du matériel.

2. Le stock net en fin de période est

$$= \sum_{i=1}^L W_i I_{it} d_i$$

où  $L$ ,  $W_i$  et  $I_{it}$  ont la même signification que précédemment, et

$$d_i = 1 - \frac{1}{L} T \quad (T = 0, 1, \dots, L - 1)$$

ce qui signifie que la valeur de l'actif diminue de façon linéaire. Là encore, cette hypothèse n'est qu'une des nombreuses possibilités. Au cours des dernières années, le système d'amortissement par le solde décroissant s'est de plus en plus répandu.

Il est à noter que les stocks ci-dessus se rapportent à la fin de chaque année civile, et qu'il est nécessaire d'apporter quelques ajustements mineurs pour le centrage des estimations sur le milieu de l'année.

Comme on l'a mentionné précédemment dans le cas de certaines industries, on dispose d'autres mesures lorsque d'autres hypothèses, comme par exemple celles d'une distribution en cloche des coefficients de pondération et de différentes fonctions d'amortissement, ont été utilisées. On espère faire paraître dans un proche avenir une publication distincte qui leur sera consacrée.

## Brève explication des termes utilisés

**Évaluation constante:** mesure les valeurs en dollars constants de 1971.

**Évaluation courante:** mesure les valeurs aux prix de l'année en cours.

**Dépréciation** (provision pour consommation de capital): prise en compte de la dégradation physique et de l'obsolescence.

**Retraits:** valeur des investissements bruts retirés du stock.

**Gross fixed capital formation** (gross investment) is the value of new fixed capital goods purchased by the industries for which stock measurement is estimated. The data are obtained from Statistics Canada, *Private and Public Investment in Canada, Outlook*, Catalogue 61-205.

The investment expenditures are grouped by types of capital assets. Construction includes building construction and all types of engineering construction such as roads, dams, transmission lines and pipelines, as well as oil drilling and mine development. The machinery and equipment category takes into account the purchase of all such items which are used either in producing goods or providing services but does not cover durable goods purchased for personal use. Included, as well as industrial machinery, are transportation equipment, agricultural implements, professional and scientific equipment, office and store furnishings and other similar capital goods. Excluded, for the purpose of this report, are outlays for machinery and equipment by the Department of National Defence.

The breakdown of construction into building and engineering construction for the two most recent years has been imputed on the basis of the 1977 disaggregation as compiled according to the Private and Public Investment Survey.

**Gross stocks** are the cumulative value of gross investment in capital goods less cumulative discards.

**Mid-year gross and net stocks** are stocks adjusted to the middle of each year. Using the notations of Text Table I they are derived as follows:

$$\frac{K_n + K_{n-1}}{2} \text{ and } \frac{NK_n + NK_{n-1}}{2}$$

**Net stocks** are gross stocks less deductions of losses in value through physical deterioration and obsolescence.

**Service life** is the length of time during which capital assets are present in useful economic production before retirement occurs.

**Straight-line depreciation** for a capital asset is equal to its gross value divided by its service life.

**Formation brute de capital fixe** (investissement brut): valeur des nouveaux biens d'immobilisation acquis par les industries dont on estime le stock. Les données sont obtenues sur les *Investissements privés et publics au Canada, Perspectives*, Statistique Canada, n° 61-205 au catalogue.

Les dépenses d'investissement sont groupées par catégorie d'actifs de nature capitale. La construction comprend les bâtiments et tous les travaux de génie, comme les routes, les barrages, les lignes de transmission et les pipe-lines, ainsi que le forage de puits de pétrole et la mise en exploitation des mines. Dans le secteur des machines et de l'outillage, les achats comprennent tous les articles employés à la production de biens et de services mais non les biens durables achetés pour usage personnel. Sous cette rubrique sont inclus, en plus des machines industrielles, le matériel de transport, les instruments agricoles, le matériel professionnel et scientifique, les ameublements de bureaux et de magasins et autres biens capitaux du même genre. Toutefois, le présent rapport ne tient pas compte des montants consacrés à l'acquisition de machines et d'outillage par le Ministère de la Défense nationale.

La décomposition des données sur bâtiment et travaux de génie pour les deux dernières années est dérivé à partir d'une désaggrégation des données de l'enquête sur les investissements privés et publics au Canada pour l'année 1977.

**Stocks bruts:** valeur cumulative des investissements bruts en capital moins les retraits cumulatifs.

**Stocks bruts et nets du milieu de l'année:** stocks ajustés sur le milieu de chaque année. En utilisant les symboles du tableau explicatif I, on les calcule suivant les formules:

$$\frac{K_n + K_{n-1}}{2} \text{ et } \frac{NK_n + NK_{n-1}}{2}$$

**Stocks nets:** stocks bruts moins pertes de valeur en raison de la dégradation physique et de l'obsolescence.

**Durée de vie:** durée de la présence des actifs de nature capitale dans la production économique utile avant retrait.

**Amortissement linéaire:** dans le cas d'un actif de nature capitale, il est égal à la valeur brute de cet actif divisée par sa durée de vie.

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.  
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

## Introduction

The procedures and problems associated with the estimates of capital stocks are fully described in Catalogue 13-522. The purpose of this introduction is to present a brief outline of the basic methodology underlying the capital flow and stock data presented in this report.

Capital stocks in existence have traditionally been considered one among several factors of production. The measurement of capital in both theoretical and technical formulations is closely related to investment to the extent that a certain technical link between the two concepts and definitions (stocks, flows) has to be established before any elaboration can be made in the direction of capital measurement.

Traditionally the relationship between the capital stock and the corresponding flow of capital services has been one of proportionality. This assumption implies that the services of capital goods acquired at different points in time are perfect substitutes in production. From this substitutability over time stems the property of proportionality between the capital services from each capital good and the stock of capital as measured by adding together all past investment acquisitions.

There is a substantial literature, both theoretical and technical, relating to the measurement of capital. Among a number of methods the "Perpetual Inventory" method is generally preferred primarily because of its malleability in the creation of time series of capital stocks.

Briefly, this method involves the accumulation over a period of years of investment expenditures by industry to obtain its capital stock in any given year.

The basic ingredients required are:

annual investment series by industry and category of expenditure;

price deflators relating to the investment series;

estimates of average economic lives of the assets used in the various industries.

The reliability of the capital stocks series thus generated depends of course on the quality of the investment data being cumulated, on the realism of

## Introduction

Les méthodes et problèmes associés aux estimations des stocks de capital sont décrits au complet dans le n° 13-522 au catalogue. La présente introduction vise à décrire brièvement la méthodologie à la base des données sur les stocks et flux de capital présentées dans la présente publication.

Les stocks de capital existants ont toujours été considérés comme l'un des facteurs de production. La mesure du capital tant du point de vue théorique que pratique est étroitement liée aux investissements, dans la mesure où il faut établir un certain lien technique entre les deux concepts et définitions (stocks, flux) avant de pouvoir progresser dans la mesure du capital.

La relation entre le stock de capital et le flux correspondant de services de nature capitale a toujours été une relation de proportionnalité. Ce postulat implique que les services des biens de capital acquis à différents moments sont des substituts parfaits dans la production. De cette notion de possibilité de substitution dans le temps découle celle de proportionnalité entre les services de nature capitale provenant de chaque bien de capital et le stock de capital, mesuré par la somme de toutes les acquisitions faites grâce aux investissements.

Un nombre appréciable d'auteurs se sont penchés sur la mesure du capital à la fois du point de vue théorique et du point de vue pratique. Parmi les diverses méthodes existantes, on préfère généralement celle de "L'inventaire perpétuel" avant tout pour sa souplesse lors de la création de séries chronologiques de stocks de capital.

En bref, il s'agit d'accumuler pendant un certain nombre d'années les dépenses d'investissements de l'industrie pour obtenir son stock de capital pour une année donnée.

Les éléments fondamentaux nécessaires sont:

les séries annuelles des investissements, par industrie et catégorie de dépense;

les indices de déflation se rapportant aux séries sur les investissements;

les estimations de la durée de vie économique moyenne des actifs utilisés par les diverses industries.

La fiabilité des séries de stock de capital ainsi produites dépend naturellement de la qualité des données sur les investissements qui ont été réunies, du réalisme à la fois

both the service life assumption and the method by which capital assets are considered to depreciate over their service life.

As an aid to a better understanding of the mechanics of the "Perpetual Inventory" method an illustration of the actual computing process is given. Assume that the capital assets in a particular industry remain in production 10 years before they are needed.

Investment expenditures pertaining to the types of capital assets in question, adjusted for prices, are cumulated for a period of ten years. In the tenth year a measure of the gross stock of this industry's capital asset is obtained. In the eleventh year the investment expenditures of the first year are deducted from the cumulated total while the purchases of capital assets of the new year are added. We proceed in the same manner for all subsequent years.

In the **gross capital stocks** capital assets are included at their full value during the entire time they remain in the capital stock. In other words, the deductions from gross investment are due to the fact that assets in question have ceased to exist. An alternative set of measures of capital stocks is derived by adjusting the value of the assets in existence for the wear and tear and obsolescence they undergo during their service life; these estimates are known as **net capital stocks**. Calculations of net capital stocks are made by applying a depreciation formula to the gross stock estimates. The **net stocks** presented in this report have been prepared by means of using the "straight-line" method. The net stock is always equal to the difference between the cumulative value of past gross investment and cumulative depreciation. Text Table I summarizes an exemplary illustration of the computational procedure involved in the "Perpetual Inventory" method. Text Table II shows the industries for which capital flow and stock estimates are presented in this volume together with the types of assets and their service lives.

In the context of the "Perpetual Inventory" method the value of the capital stock can also be viewed as the weighted sum of past gross investment expenditures. The weights used can be thought of as the resultant of two factors. The first factor relates to the mortality of an asset, namely the probability that the assets of a certain age are in existence when the stock is being estimated. In other words this factor relates to the depreciation in the sense of physical decay, retirement, etc.

The second factor deals with the value of the assets still present in the stock. If the items included in the stock retain their original value then of course we are measuring the gross stock; if their value is diminishing over their service life then we are measuring the net stocks where allowances have been made for wear and tear and obsolescence.

de l'hypothèse de durée de vie et de la méthode que l'on a retenue pour la dépréciation des actifs de nature capitale tout au long de leur vie utile.

Afin de mieux faire saisir le mécanisme de la méthode de "L'inventaire perpétuel", le lecteur trouvera ci-après une illustration du processus réel de calcul. Supposons que les actifs de nature capitale d'une industrie donnée demeurent en production 10 ans avant d'être retirés.

Les dépenses d'investissement se rapportant aux catégories d'actifs de capital considérées, après déflation, sont sommées sur une période de dix ans. La dixième année, on obtient une mesure du stock brut des actifs de capital de cette industrie. La onzième année, on déduit les dépenses d'investissement de la première année du total cumulatif, et on ajoute les achats de nature capitale au cours de la nouvelle année. On procède ainsi de la même manière pour toutes les années suivantes.

On regroupe dans les **stocks bruts de capital** les actifs de nature capitale à leur valeur intégrale tant que ces actifs font partie du stock de capital. En d'autres termes, les déductions sur les investissements bruts s'expliquent par le fait que les actifs en question ont cessé d'exister. On obtient un autre ensemble de mesures des stocks de capital en ajustant la valeur des actifs existants pour prendre en compte l'usure et l'obsolescence qu'ils subissent lors de leur durée de vie, et l'on appelle ces estimations **stocks nets de capital**. On calcule les stocks nets de capital grâce à une formule d'amortissement que l'on fait intervenir dans les estimations des stocks bruts. Les **stocks nets** indiqués dans la présente publication ont été calculés grâce à la méthode dite "linéaire". Le stock net est toujours égal à la différence entre la valeur cumulative des investissements bruts antérieurs et la dépréciation accumulée. On trouvera au tableau explicatif I un exemple récapitulatif de la méthode de calcul utilisée dans la méthode de "L'inventaire perpétuel". Le tableau explicatif II présente les industries dont les estimations des flux et stocks de capital figurent dans le présent ouvrage, ainsi que les différentes catégories d'actifs et leurs durées de vie.

Dans le cadre de la méthode de "L'inventaire perpétuel", on peut aussi considérer la valeur du stock de capital comme la somme pondérée des dépenses d'investissement brutes antérieures. Les coefficients de pondération utilisés peuvent être considérés comme le résultat de deux facteurs. Le premier de ces facteurs se rapporte à la disparition d'un actif, c'est-à-dire à la probabilité que les actifs d'un certain âge existent encore lors de l'estimation du stock. En d'autres termes, ce facteur se rapporte à la dépréciation, dans le sens de dégradation physique, de retrait, etc.

Le second facteur a trait à la valeur des actifs faisant encore partie du stock. Si les éléments du stock conservent leur valeur originale, naturellement nous mesurons alors le stock brut; si leur valeur diminue tout au long de leur durée de vie, nous mesurons alors les stocks nets, après avoir pris en compte l'usure et l'obsolescence.

We can summarize the nature of the calculations involved in measuring the stock of capital in the following fashion:

$$1. \text{ Gross stock at the end of period} = \sum_{i=1}^L W_i I_{it}$$

where  $L$  = the assumed economic life of the capital asset,  $W_i = 1$  during the lifetime of the asset and  $I_{it}$  = the investment expenditures during each period. This assumption about the weight ( $W_i = 1$ ) is only one among many possibilities such as a distribution of weights derived from studies of the "survival curves" of individual pieces of equipment.

2. Net stock at the end of the period

$$= \sum_{i=1}^L W_i I_{it} d_i$$

where  $L$ ,  $W_i$  and  $I_{it}$  as before and

$$d_i = 1 - \frac{1}{L} T \quad (T = 0, 1, \dots, L - 1)$$

which indicates that the value of the asset declines linearly. Again this assumption is one among many alternatives. In recent years the diminishing balance system of depreciation has become increasingly popular.

It should be noted that the above stocks relate to the end of each calendar year and some minor adjustments are necessary to centre the estimates of the middle of each calendar year.

As mentioned before for certain industries alternative measures are available where alternative assumptions such as a bell-shaped distribution of weights and different depreciation functions have been used. It is hoped that in the near future a separate publication dealing with these alternative measures will become available.

## Brief Explanation of Terms

**Constant valuation** measures values in constant prices (1971).

**Current valuation** measures values in the prices of the given year.

**Depreciation** (capital consumption allowance) is the allowance made for physical deterioration and obsolescence.

**Discards** (retirements) are the value of gross investment that is withdrawn from the stock.

Nous pouvons résumer ainsi la nature des calculs entraînés par la mesure du stock de capital:

$$1. \text{ Le stock brut en fin de période est } = \sum_{i=1}^L W_i I_{it}$$

où  $L$  est la durée de vie présumée de l'actif, et  $I_{it}$  sont les dépenses d'investissement au cours de chaque période. L'hypothèse relative au coefficient de pondération ( $W_i = 1$ ) n'est qu'une des nombreuses possibilités, comme par exemple une distribution des coefficients de pondération obtenue à partir d'études des "courbes de survie" des différents éléments du matériel.

2. Le stock net en fin de période est

$$= \sum_{i=1}^L W_i I_{it} d_i$$

où  $L$ ,  $W_i$  et  $I_{it}$  ont la même signification que précédemment, et

$$d_i = 1 - \frac{1}{L} T \quad (T = 0, 1, \dots, L - 1)$$

ce qui signifie que la valeur de l'actif diminue de façon linéaire. Là encore, cette hypothèse n'est qu'une des nombreuses possibilités. Au cours des dernières années, le système d'amortissement par le solde décroissant s'est de plus en plus répandu.

Il est à noter que les stocks ci-dessus se rapportent à la fin de chaque année civile, et qu'il est nécessaire d'apporter quelques ajustements mineurs pour le centrage des estimations sur le milieu de l'année.

Comme on l'a mentionné précédemment dans le cas de certaines industries, on dispose d'autres mesures lorsque d'autres hypothèses, comme par exemple celles d'une distribution en cloche des coefficients de pondération et de différentes fonctions d'amortissement, ont été utilisées. On espère faire paraître dans un proche avenir une publication distincte qui leur sera consacrée.

## Brève explication des termes utilisés

**Évaluation constante:** mesure les valeurs en dollars constants de 1971.

**Évaluation courante:** mesure les valeurs aux prix de l'année en cours.

**Dépréciation** (provision pour consommation de capital): prise en compte de la dégradation physique et de l'obsolescence.

**Retraits:** valeur des investissements bruts retirés du stock.

**Gross fixed capital formation** (gross investment) is the value of new fixed capital goods purchased by the industries for which stock measurement is estimated. The data are obtained from Statistics Canada, *Private and Public Investment in Canada, Outlook*, Catalogue 61 - 205.

The investment expenditures are grouped by types of capital assets. Construction includes building construction and all types of engineering construction such as roads, dams, transmission lines and pipelines, as well as oil drilling and mine development. The machinery and equipment category takes into account the purchase of all such items which are used either in producing goods or providing services but does not cover durable goods purchased for personal use. Included, as well as industrial machinery, are transportation equipment, agricultural implements, professional and scientific equipment, office and store furnishings and other similar capital goods. Excluded, for the purpose of this report, are outlays for machinery and equipment by the Department of National Defence.

The breakdown of construction into building and engineering construction for the two most recent years has been imputed on the basis of the average disaggregation from 1976 to 1978, as compiled according to the Private and Public Investment Survey. The following industries were surveyed directly: Mining, Air, Railway, Water, Motor and Urban Transport, Electric Power and Federal, Provincial and Municipal Governments.

**Gross stocks** are the cumulative value of gross investment in capital goods less cumulative discards.

**Mid-year gross and net stocks** are stocks adjusted to the middle of each year. Using the notations of Text Table I they are derived as follows:

$$\frac{K_n + K_{n-1}}{2} \text{ and } \frac{NK_n + NK_{n-1}}{2}$$

**Net stocks** are gross stocks less deductions of losses in value through physical deterioration and obsolescence.

**Service life** is the length of time during which capital assets are present in useful economic production before retirement occurs.

**Straight-line depreciation** for a capital asset is equal to its gross value divided by its service life.

**Formation brute de capital fixe** (investissement brut): valeur des nouveaux biens d'immobilisation acquis par les industries dont on estime le stock. Les données sont obtenues sur les *Investissements privés et publics au Canada, Perspectives*, Statistique Canada, n° 61 - 205 au catalogue.

Les dépenses d'investissement sont groupées par catégorie d'actifs de nature capitale. La construction comprend les bâtiments et tous les travaux de génie, comme les routes, les barrages, les lignes de transmission et les pipe-lines, ainsi que le forage de puits de pétrole et la mise en exploitation des mines. Dans le secteur des machines et de l'outillage, les achats comprennent tous les articles employés à la production de biens et de services mais non les biens durables achetés pour usage personnel. Sous cette rubrique sont inclus, en plus des machines industrielles, le matériel de transport, les instruments agricoles, le matériel professionnel et scientifique, les ameublements de bureaux et de magasins et autres biens capitaux du même genre. Toutefois, le présent rapport ne tient pas compte des montants consacrés à l'acquisition de machines et d'outillage par le Ministère de la Défense nationale.

La décomposition des données en bâtiment et travaux de génie pour les deux dernières années est dérivée à partir d'une moyenne des désaggrégations des données de l'enquête sur les investissements privés et publics au Canada, pour les années 1976 à 1978. Les résultats pour les mines, le transport aérien, par chemin de fer, par eau, routier et urbain, l'énergie électrique et les gouvernements fédéral, provinciaux et municipaux sont basés sur une enquête directe.

**Stocks bruts:** valeur cumulative des investissements bruts en capital moins les retraits cumulatifs.

**Stocks bruts et nets du milieu de l'année:** stocks ajustés sur le milieu de chaque année. En utilisant les symboles du tableau explicatif I, on les calcule suivant les formules:

$$\frac{K_n + K_{n-1}}{2} \text{ et } \frac{NK_n + NK_{n-1}}{2}$$

**Stocks nets:** stocks bruts moins pertes de valeur en raison de la dégradation physique et de l'obsolescence.

**Durée de vie:** durée de la présence des actifs de nature capitale dans la production économique utile avant retrait.

**Amortissement linéaire:** dans le cas d'un actif de nature capitale, il est égal à la valeur brute de cet actif divisée par sa durée de vie.

TEXT TABLE I. Example: Assumed Service Life = 10 Years = L

TABLEAU EXPLICATIF I. Exemple: Durée de vie supposée de 10 ans = L

## Note

This and other government publications may be purchased from local authorized agents and other community bookstores or by mail order.

Mail orders should be sent to Publication Sales and Services, Statistics Canada, Ottawa, K1A 0V7, or to Publishing Centre, Supply and Services Canada, Ottawa, K1A 0S9.

Inquiries about this publication should be addressed to:

National Wealth and Capital Stock Section,  
Construction Division,

Statistics Canada, Ottawa, K1A 0T6 (telephone: 995-8152) or to a local Advisory Services office:

St. John's (Nfld.)	(737-4073)
Halifax	(426-5331)
Montréal	(283-5725)
Ottawa	(992-4734)
Toronto	(966-6586)
Winnipeg	(949-4020)
Regina	(359-5405)
Edmonton	(420-3027)
Vancouver	(666-3695)

Toll-free access to the regional statistical information service is provided in Nova Scotia, New Brunswick, and Prince Edward Island by telephoning 1-800-565-7192. Throughout Saskatchewan, the Regina office can be reached by dialing 1(112)800-667-3524, and throughout Alberta, the Edmonton office can be reached by dialing 1-800-222-6400.

## Nota

On peut se procurer cette publication, ainsi que toutes les publications du gouvernement du Canada, auprès des agents autorisés locaux, dans les librairies ordinaires ou par la poste.

Les commandes par la poste devront parvenir à Ventes et services de publications, Statistique Canada, Ottawa, K1A 0V7, ou à Imprimerie et édition, Approvisionnements et Services Canada, Ottawa, K1A 0S9.

Toutes demandes de renseignements sur la présente publication doivent être adressées à:

Section de la richesse nationale et des stocks de capital,  
Division de la construction,

Statistique Canada, Ottawa, K1A 0T6 (téléphone: 995-8152) ou à un bureau local des Services consultatifs situé aux endroits suivants:

St. John's (T.-N.)	(737-4073)
Halifax	(426-5331)
Montréal	(283-5725)
Ottawa	(992-4734)

## Introduction

The procedures and problems associated with the estimates of capital stocks are fully described in Catalogue 13-522. The purpose of this introduction is to present a brief outline of the basic methodology underlying the capital flow and stock data presented in this report.

Capital stocks in existence have traditionally been considered one among several factors of production. The measurement of capital in both theoretical and technical formulations is closely related to investment to the extent that a certain technical link between the two concepts and definitions (stocks, flows) has to be established before any elaboration can be made in the direction of capital measurement.

Traditionally the relationship between the capital stock and the corresponding flow of capital services has been one of proportionality. This assumption implies that the services of capital goods acquired at different points in time are perfect substitutes in production. From this substitutability over time stems the property of proportionality between the capital services from each capital good and the stock of capital as measured by adding together all past investment acquisitions.

There is a substantial literature, both theoretical and technical, relating to the measurement of capital. Among a number of methods the "Perpetual Inventory" method is generally preferred primarily because of its malleability in the creation of time series of capital stocks.

Briefly, this method involves the accumulation over a period of years of investment expenditures by industry to obtain its capital stock in any given year.

The basic ingredients required are:

annual investment series by industry and category of expenditure;

price deflators relating to the investment series;

estimates of average economic lives of the assets used in the various industries.

The reliability of the capital stocks series thus generated depends of course on the quality of the investment data being cumulated, on the realism of

## Introduction

Les méthodes et problèmes associés aux estimations des stocks de capital sont décrits au complet dans le n° 13-522 au catalogue. La présente introduction vise à décrire brièvement la méthodologie à la base des données sur les stocks et flux de capital présentées dans la présente publication.

Les stocks de capital existants ont toujours été considérés comme l'un des facteurs de production. La mesure du capital tant du point de vue théorique que pratique est étroitement liée aux investissements, dans la mesure où il faut établir un certain lien technique entre les deux concepts et définitions (stocks, flux) avant de pouvoir progresser dans la mesure du capital.

La relation entre le stock de capital et le flux correspondant de services de nature capitale a toujours été une relation de proportionnalité. Ce postulat implique que les services des biens de capital acquis à différents moments sont des substituts parfaits dans la production. De cette notion de possibilité de substitution dans le temps découle celle de proportionnalité entre les services de nature capitale provenant de chaque bien de capital et le stock de capital, mesuré par la somme de toutes les acquisitions faites grâce aux investissements.

Un nombre appréciable d'auteurs se sont penchés sur la mesure du capital à la fois du point de vue théorique et du point de vue pratique. Parmi les diverses méthodes existantes, on préfère généralement celle de "L'inventaire perpétuel" avant tout pour sa souplesse lors de la création de séries chronologiques de stocks de capital.

En bref, il s'agit d'accumuler pendant un certain nombre d'années les dépenses d'investissements de l'industrie pour obtenir son stock de capital pour une année donnée.

Les éléments fondamentaux nécessaires sont:

les séries annuelles des investissements, par industrie et catégorie de dépense;

les indices de déflation se rapportant aux séries sur les investissements;

les estimations de la durée de vie économique moyenne des actifs utilisés par les diverses industries.

La fiabilité des séries de stock de capital ainsi produites dépend naturellement de la qualité des données sur les investissements qui ont été réunies, du réalisme à la fois

both the service life assumption and the method by which capital assets are considered to depreciate over their service life.

As an aid to a better understanding of the mechanics of the "Perpetual Inventory" method an illustration of the actual computing process is given. Assume that the capital assets in a particular industry remain in production 10 years before they are needed.

Investment expenditures pertaining to the types of capital assets in question, adjusted for prices, are cumulated for a period of 10 years. In the tenth year a measure of the gross stock of this industry's capital asset is obtained. In the eleventh year the investment expenditures of the first year are deducted from the cumulated total while the purchases of capital assets of the new year are added. We proceed in the same manner for all subsequent years.

In the **gross capital stocks** capital assets are included at their full value during the entire time they remain in the capital stock. In other words, the deductions from gross investment are due to the fact that assets in question have ceased to exist. An alternative set of measures of capital stocks is derived by adjusting the value of the assets in existence for the wear and tear and obsolescence they undergo during their service life; these estimates are known as **net capital stocks**. Calculations of net capital stocks are made by applying a depreciation formula to the gross stock estimates. The **net stocks** presented in this report have been prepared by means of using the "straight-line" method. The net stock is always equal to the difference between the cumulative value of past gross investment and cumulative depreciation. Text Table I summarizes an exemplary illustration of the computational procedure involved in the "Perpetual Inventory" method. Text Table II shows the industries for which capital flow and stock estimates are presented in this volume together with the types of assets and their service lives.

In the context of the "Perpetual Inventory" method the value of the capital stock can also be viewed as the weighted sum of past gross investment expenditures. The weights used can be thought of as the resultant of two factors. The first factor relates to the mortality of an asset, namely the probability that the assets of a certain age are in existence when the stock is being estimated. In other words this factor relates to the depreciation in the sense of physical decay, retirement, etc.

The second factor deals with the value of the assets still present in the stock. If the items included in the stock retain their original value then of course we are measuring the gross stock; if their value is diminishing over their service life then we are measuring the net stocks where allowances have been made for wear and tear and obsolescence.

de l'hypothèse de durée de vie et de la méthode que l'on a retenue pour la dépréciation des actifs de nature capitale tout au long de leur vie utile.

Afin de mieux faire saisir le mécanisme de la méthode de "L'inventaire perpétuel", le lecteur trouvera ci-après une illustration du processus réel de calcul. Supposons que les actifs de nature capitale d'une industrie donnée demeurent en production 10 ans avant d'être retirés.

Les dépenses d'investissement se rapportant aux catégories d'actifs de capital considérées, après déflation, sont sommées sur une période de 10 ans. La dixième année, on obtient une mesure du stock brut des actifs de capital de cette industrie. La onzième année, on déduit les dépenses d'investissement de la première année du total cumulé, et on ajoute les achats de nature capitale au cours de la nouvelle année. On procède ainsi de la même manière pour toutes les années suivantes.

On regroupe dans les **stocks bruts de capital** les actifs de nature capitale à leur valeur intégrale tant que ces actifs font partie du stock de capital. En d'autres termes, les déductions sur les investissements bruts s'expliquent par le fait que les actifs en question ont cessé d'exister. On obtient un autre ensemble de mesures des stocks de capital en ajustant la valeur des actifs existants pour prendre en compte l'usure et l'obsolescence qu'ils subissent lors de leur durée de vie, et l'on appelle ces estimations **stocks nets de capital**. On calcule les stocks nets de capital grâce à une formule d'amortissement que l'on fait intervenir dans les estimations des stocks bruts. Les **stocks nets** indiqués dans la présente publication ont été calculés grâce à la méthode dite "linéaire". Le stock net est toujours égal à la différence entre la valeur cumulative des investissements bruts antérieurs et la dépréciation accumulée. On trouvera au tableau explicatif I un exemple récapitulatif de la méthode de calcul utilisée dans la méthode de "L'inventaire perpétuel". Le tableau explicatif II présente les industries dont les estimations des flux et stocks de capital figurent dans le présent ouvrage, ainsi que les différentes catégories d'actifs et leurs durées de vie.

Dans le cadre de la méthode de "L'inventaire perpétuel", on peut aussi considérer la valeur du stock de capital comme la somme pondérée des dépenses d'investissement brutes antérieures. Les coefficients de pondération utilisés peuvent être considérés comme le résultat de deux facteurs. Le premier de ces facteurs se rapporte à la disparition d'un actif, c'est-à-dire à la probabilité que les actifs d'un certain âge existent encore lors de l'estimation du stock. En d'autres termes, ce facteur se rapporte à la dépréciation, dans le sens de dégradation physique, de retrait, etc.

Le second facteur a trait à la valeur des actifs faisant encore partie du stock. Si les éléments du stock conservent leur valeur originale, naturellement nous mesurons alors le stock brut; si leur valeur diminue tout au long de leur durée de vie, nous mesurons alors les stocks nets, après avoir pris en compte l'usure et l'obsolescence.

We can summarize the nature of the calculations involved in measuring the stock of capital in the following fashion:

$$1. \text{ Gross stock at the end of period} = \sum_{i=1}^L W_i I_{it}$$

where  $L$  = the assumed economic life of the capital asset,  $W_i = 1$  during the lifetime of the asset and  $I_{it}$  = the investment expenditures during each period. This assumption about the weight ( $W_i = 1$ ) is only one among many possibilities such as a distribution of weights derived from studies of the "survival curves" of individual pieces of equipment.

2. Net stock at the end of the period

$$= \sum_{i=1}^L W_i I_{it} d_i$$

where  $L$ ,  $W_i$  and  $I_{it}$  as before and

$$d_i = 1 - \frac{1}{L} T \quad (T = 0, 1, \dots, L - 1)$$

which indicates that the value of the asset declines linearly. Again this assumption is one among many alternatives. In recent years the diminishing balance system of depreciation has become increasingly popular.

It should be noted that the above stocks relate to the end of each calendar year and some minor adjustments are necessary to centre the estimates of the middle of each calendar year.

As mentioned before for certain industries alternative measures are available where alternative assumptions such as a bell-shaped distribution of weights and different depreciation functions have been used. It is hoped that in the near future a separate publication dealing with these alternative measures will become available.

## Brief Explanation of Terms

**Constant valuation** measures values in constant prices (1971).

**Current valuation** measures values in the prices of the given year.

**Depreciation** (capital consumption allowance) is the allowance made for physical deterioration and obsolescence.

**Discards** (retirements) are the value of gross investment that is withdrawn from the stock.

Nous pouvons résumer ainsi la nature des calculs entraînés par la mesure du stock de capital:

$$1. \text{ Le stock brut en fin de période est } = \sum_{i=1}^L W_i I_{it}$$

où  $L$  est la durée de vie présumée de l'actif, et  $I_{it}$  sont les dépenses d'investissement au cours de chaque période. L'hypothèse relative au coefficient de pondération ( $W_i = 1$ ) n'est qu'une des nombreuses possibilités, comme par exemple une distribution des coefficients de pondération obtenue à partir d'études des "courbes de survie" des différents éléments du matériel.

2. Le stock net en fin de période est

$$= \sum_{i=1}^L W_i I_{it} d_i$$

où  $L$ ,  $W_i$  et  $I_{it}$  ont la même signification que précédemment, et

$$d_i = 1 - \frac{1}{L} T \quad (T = 0, 1, \dots, L - 1)$$

ce qui signifie que la valeur de l'actif diminue de façon linéaire. Là encore, cette hypothèse n'est qu'une des nombreuses possibilités. Au cours des dernières années, le système d'amortissement par le solde décroissant s'est de plus en plus répandu.

Il est à noter que les stocks ci-dessus se rapportent à la fin de chaque année civile, et qu'il est nécessaire d'apporter quelques ajustements mineurs pour le centrage des estimations sur le milieu de l'année.

Comme on l'a mentionné précédemment dans le cas de certaines industries, on dispose d'autres mesures lorsque d'autres hypothèses, comme par exemple celles d'une distribution en cloche des coefficients de pondération et de différentes fonctions d'amortissement, ont été utilisées. On espère faire paraître dans un proche avenir une publication distincte qui leur sera consacrée.

## Brève explication des termes utilisés

**Évaluation constante:** mesure les valeurs en dollars constants de 1971.

**Évaluation courante:** mesure les valeurs aux prix de l'année en cours.

**Dépréciation** (provision pour consommation de capital): prise en compte de la dégradation physique et de l'obsolescence.

**Retraits:** valeur des investissements bruts retirés du stock.

**Gross fixed capital formation** (gross investment) is the value of new fixed capital goods purchased by the industries for which stock measurement is estimated. The data are obtained from Statistics Canada, *Private and Public Investment in Canada, Outlook*, Catalogue 61-205.

The investment expenditures are grouped by types of capital assets. Construction includes building construction and all types of engineering construction such as roads, dams, transmission lines and pipelines, as well as oil drilling and mine development. The machinery and equipment category takes into account the purchase of all such items which are used either in producing goods or providing services but does not cover durable goods purchased for personal use. Included, as well as industrial machinery, are transportation equipment, agricultural implements, professional and scientific equipment, office and store furnishings and other similar capital goods. Excluded, for the purpose of this report, are outlays for machinery and equipment by the Department of National Defence.

The breakdown of construction into building and engineering construction for the two most recent years has been imputed on the basis of the average disaggregation from 1976 to 1978, as compiled according to the Private and Public Investment Survey. The following industries were surveyed directly: Mining, Air, Railway, Water, Motor and Urban Transport, Electric Power and Federal, Provincial and Municipal Governments.

**Gross stocks** are the cumulative value of gross investment in capital goods less cumulative discards.

**Mid-year gross and net stocks** are stocks adjusted to the middle of each year. Using the notations of Text Table I they are derived as follows:

$$\frac{K_n + K_{n-1}}{2} \text{ and } \frac{NK_n + NK_{n-1}}{2}$$

**Net stocks** are gross stocks less deductions of losses in value through physical deterioration and obsolescence.

**Service life** is the length of time during which capital assets are present in useful economic production before retirement occurs.

**Straight-line depreciation** for a capital asset is equal to its gross value divided by its service life.

**Formation brute de capital fixe** (investissement brut): valeur des nouveaux biens d'immobilisation acquis par les industries dont on estime le stock. Les données sont obtenues sur les *Investissements privés et publics au Canada, Perspectives*, Statistique Canada, n° 61-205 au catalogue.

Les dépenses d'investissement sont groupées par catégorie d'actifs de nature capitale. La construction comprend les bâtiments et tous les travaux de génie, comme les routes, les barrages, les lignes de transmission et les pipe-lines, ainsi que le forage de puits de pétrole et la mise en exploitation des mines. Dans le secteur des machines et de l'outillage, les achats comprennent tous les articles employés à la production de biens et de services mais non les biens durables achetés pour usage personnel. Sous cette rubrique sont inclus, en plus des machines industrielles, le matériel de transport, les instruments agricoles, le matériel professionnel et scientifique, les ameublements de bureaux et de magasins et autres biens capitaux du même genre. Toutefois, le présent rapport ne tient pas compte des montants consacrés à l'acquisition de machines et d'outillage par le Ministère de la Défense nationale.

La décomposition des données en bâtiment et travaux de génie pour les deux dernières années est dérivée à partir d'une moyenne des désaggrégations des données de l'enquête sur les investissements privés et publics au Canada, pour les années 1976 à 1978. Les résultats pour les mines, le transport aérien, par chemin de fer, par eau, routier et urbain, l'énergie électrique et les gouvernements fédéral, provinciaux et municipaux sont basés sur une enquête directe.

**Stocks bruts:** valeur cumulative des investissements bruts en capital moins les retraits cumulatifs.

**Stocks bruts et nets du milieu de l'année:** stocks ajustés sur le milieu de chaque année. En utilisant les symboles du tableau explicatif I, on les calcule suivant les formules:

$$\frac{K_n + K_{n-1}}{2} \text{ et } \frac{NK_n + NK_{n-1}}{2}$$

**Stocks nets:** stocks bruts moins pertes de valeur en raison de la dégradation physique et de l'obsolescence.

**Durée de vie:** durée de la présence des actifs de nature capitale dans la production économique utile avant retrait.

**Amortissement linéaire:** dans le cas d'un actif de nature capitale, il est égal à la valeur brute de cet actif divisée par sa durée de vie.

Fixed Capital Flows and Stocks,  
Manufacturing and Non-  
manufacturing Industries, 1976-1980

Flux et stocks de capital fixe,  
industries manufacturières  
et non-manufacturières, 1976-1980

**Total Manufacturing and Non-manufacturing Industries (Excluding Housing)**  
**Ensemble des industries manufacturières et non-manufacturières (exclus domiciliaire)**

Year - Année	Gross fixed capital formation - Formation brute de capital fixe	Net fixed capital formation - Formation nette de capital fixe	Capital consumption allowances - Provisions pour con- sommation de capital	Mid-year gross stock - Stock brut de mi-année	Mid-year net stock - Stock net de mi-année	Gross fixed capital formation - Formation brute de capital fixe	Net fixed capital formation - Formation nette de capital fixe	Capital consumption allowances - Provisions pour con- sommation de capital	Mid-year gross stock - Stock brut de mi-année	Mid-year net stock - Stock net de mi-année

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.  
Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

**Total Manufacturing Industries**  
**Ensemble des industries manufacturières**

## Data in Many Forms . . .

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

## How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

National Wealth and Capital Stock Section,  
Construction Division,

Statistics Canada, Ottawa, K1A 0T6 (Telephone: 995-8152) or to the Statistics Canada reference centre in:

St. John's	(772-4073)	Winnipeg	(949-4020)
Halifax	(426-5331)	Regina	(359-5405)
Montreal	(283-5725)	Edmonton	(420-3027)
Ottawa	(992-4734)	Vancouver	(666-3691)
Toronto	(966-6586)		

Toll free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional reference centres.

Newfoundland and Labrador	Zenith 0-7037
Nova Scotia, New Brunswick and Prince Edward Island	1-800-565-7192
Quebec	1-800-361-2831

## How to Order Publications

This and other Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the local Statistics Canada offices, or by mail order to Publication Sales and Services, Statistics Canada, Ottawa, K1A 0V7.

## Des données sous plusieurs formes . . .

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordinarolingue et le système d'extraction de Statistique Canada.

## Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section de la richesse nationale et des stocks de capital,  
Division de la construction,

Statistique Canada, Ottawa, K1A 0T6 (téléphone: 995-8152) ou au centre de consultation de Statistique Canada à:

St. John's	(772-4073)	Winnipeg	(949-4020)
Halifax	(426-5331)	Régina	(359-5405)
Montréal	(283-5725)	Edmonton	(420-3027)
Ottawa	(992-4734)	Vancouver	(666-3691)
Toronto	(966-6586)		

Un service de communication sans frais est offert, dans toutes les provinces et dans les territoires, aux utilisateurs qui habitent à l'extérieur des zones de communication locale des centres régionaux de consultation.

## Introduction

The procedures and problems associated with the estimates of capital stocks are fully described in Catalogue 13-522. The purpose of this introduction is to present a brief outline of the basic methodology underlying the capital flow and stock data presented in this report.

Capital stocks in existence have traditionally been considered one among several factors of production. The measurement of capital in both theoretical and technical formulations is closely related to investment to the extent that a certain technical link between the two concepts and definitions (stocks, flows) has to be established before any elaboration can be made in the direction of capital measurement.

Traditionally the relationship between the capital stock and the corresponding flow of capital services has been one of proportionality. This assumption implies that the services of capital goods acquired at different points in time are perfect substitutes in production. From this substitutability over time stems the property of proportionality between the capital services from each capital good and the stock of capital as measured by adding together all past investment acquisitions.

There is a substantial literature, both theoretical and technical, relating to the measurement of capital. Among a number of methods the "Perpetual Inventory" method is generally preferred primarily because of its malleability in the creation of time series of capital stocks.

Briefly, this method involves the accumulation over a period of years of investment expenditures by industry to obtain its capital stock in any given year.

The basic ingredients required are:

annual investment series by industry and category of expenditure;

price deflators relating to the investment series;

estimates of average economic lives of the assets used in the various industries.

The reliability of the capital stocks series thus generated depends of course on the quality of the investment data being cumulated, on the realism of

## Introduction

Les méthodes et problèmes associés aux estimations des stocks de capital sont décrits au complet dans le n° 13-522 au catalogue. La présente introduction vise à décrire brièvement la méthodologie à la base des données sur les stocks et flux de capital présentées dans la présente publication.

Les stocks de capital existants ont toujours été considérés comme l'un des facteurs de production. La mesure du capital tant du point de vue théorique que pratique est étroitement liée aux investissements, dans la mesure où il faut établir un certain lien technique entre les deux concepts et définitions (stocks, flux) avant de pouvoir progresser dans la mesure du capital.

La relation entre le stock de capital et le flux correspondant de services de nature capitale a toujours été une relation de proportionnalité. Ce postulat implique que les services des biens de capital acquis à différents moments sont des substituts parfaits dans la production. De cette notion de possibilité de substitution dans le temps découle celle de proportionnalité entre les services de nature capitale provenant de chaque bien de capital et le stock de capital, mesuré par la somme de toutes les acquisitions faites grâce aux investissements.

Un nombre appréciable d'auteurs se sont penchés sur la mesure du capital à la fois du point de vue théorique et du point de vue pratique. Parmi les diverses méthodes existantes, on préfère généralement celle de "L'inventaire perpétuel" avant tout pour sa souplesse lors de la création de séries chronologiques de stocks de capital.

En bref, il s'agit d'accumuler pendant un certain nombre d'années les dépenses d'investissements de l'industrie pour obtenir son stock de capital pour une année donnée.

Les éléments fondamentaux nécessaires sont:

les séries annuelles des investissements, par industrie et catégorie de dépense;

les indices de déflation se rapportant aux séries sur les investissements;

les estimations de la durée de vie économique moyenne des actifs utilisés par les diverses industries.

La fiabilité des séries de stock de capital ainsi produites dépend naturellement de la qualité des données sur les investissements qui ont été réunies, du réalisme à la fois

both the service life assumption and the method by which capital assets are considered to depreciate over their service life.

As an aid to a better understanding of the mechanics of the "Perpetual Inventory" method an illustration of the actual computing process is given. Assume that the capital assets in a particular industry remain in production 10 years before they are needed.

Investment expenditures pertaining to the types of capital assets in question, adjusted for prices, are cumulated for a period of 10 years. In the tenth year a measure of the gross stock of this industry's capital asset is obtained. In the eleventh year the investment expenditures of the first year are deducted from the cumulated total while the purchases of capital assets of the new year are added. We proceed in the same manner for all subsequent years.

In the **gross capital stocks** capital assets are included at their full value during the entire time they remain in the capital stock. In other words, the deductions from gross investment are due to the fact that assets in question have ceased to exist. An alternative set of measures of capital stocks is derived by adjusting the value of the assets in existence for the wear and tear and obsolescence they undergo during their service life; these estimates are known as **net capital stocks**. Calculations of net capital stocks are made by applying a depreciation formula to the gross stock estimates. The **net stocks** presented in this report have been prepared by means of using the "straight-line" method. The net stock is always equal to the difference between the cumulative value of past gross investment and cumulative depreciation. Text Table I summarizes an exemplary illustration of the computational procedure involved in the "Perpetual Inventory" method. Text Table II shows the industries for which capital flow and stock estimates are presented in this volume together with the types of assets and their service lives.

In the context of the "Perpetual Inventory" method the value of the capital stock can also be viewed as the weighted sum of past gross investment expenditures. The weights used can be thought of as the resultant of two factors. The first factor relates to the mortality of an asset, namely the probability that the assets of a certain age are in existence when the stock is being estimated. In other words this factor relates to the depreciation in the sense of physical decay, retirement, etc.

The second factor deals with the value of the assets still present in the stock. If the items included in the stock retain their original value then of course we are measuring the gross stock; if their value is diminishing over their service life then we are measuring the net stocks where allowances have been made for wear and tear and obsolescence.

de l'hypothèse de durée de vie et de la méthode que l'on a retenue pour la dépréciation des actifs de nature capitale tout au long de leur vie utile.

Afin de mieux faire saisir le mécanisme de la méthode de "L'inventaire perpétuel", le lecteur trouvera ci-après une illustration du processus réel de calcul. Supposons que les actifs de nature capitale d'une industrie donnée demeurent en production 10 ans avant d'être retirés.

Les dépenses d'investissement se rapportant aux catégories d'actifs de capital considérées, après déflation, sont sommées sur une période de 10 ans. La dixième année, on obtient une mesure du stock brut des actifs de capital de cette industrie. La onzième année, on déduit les dépenses d'investissement de la première année du total cumulatif, et on ajoute les achats de nature capitale au cours de la nouvelle année. On procède ainsi de la même manière pour toutes les années suivantes.

On regroupe dans les **stocks bruts de capital** les actifs de nature capitale à leur valeur intégrale tant que ces actifs font partie du stock de capital. En d'autres termes, les déductions sur les investissements bruts s'expliquent par le fait que les actifs en question ont cessé d'exister. On obtient un autre ensemble de mesures des stocks de capital en ajustant la valeur des actifs existants pour prendre en compte l'usure et l'obsolescence qu'ils subissent lors de leur durée de vie, et l'on appelle ces estimations **stocks nets de capital**. On calcule les stocks nets de capital grâce à une formule d'amortissement que l'on fait intervenir dans les estimations des stocks bruts. Les **stocks nets** indiqués dans la présente publication ont été calculés grâce à la méthode dite "linéaire". Le stock net est toujours égal à la différence entre la valeur cumulative des investissements bruts antérieurs et la dépréciation accumulée. On trouvera au tableau explicatif I un exemple récapitulatif de la méthode de calcul utilisée dans la méthode de "L'inventaire perpétuel". Le tableau explicatif II présente les industries dont les estimations des flux et stocks de capital figurent dans le présent ouvrage, ainsi que les différentes catégories d'actifs et leurs durées de vie.

Dans le cadre de la méthode de "L'inventaire perpétuel", on peut aussi considérer la valeur du stock de capital comme la somme pondérée des dépenses d'investissement brutes antérieures. Les coefficients de pondération utilisés peuvent être considérés comme le résultat de deux facteurs. Le premier de ces facteurs se rapporte à la disparition d'un actif, c'est-à-dire à la probabilité que les actifs d'un certain âge existent encore lors de l'estimation du stock. En d'autres termes, ce facteur se rapporte à la dépréciation, dans le sens de dégradation physique, de retrait, etc.

Le second facteur a trait à la valeur des actifs faisant encore partie du stock. Si les éléments du stock conservent leur valeur originale, naturellement nous mesurons alors le stock brut; si leur valeur diminue tout au long de leur durée de vie, nous mesurons alors les stocks nets, après avoir pris en compte l'usure et l'obsolescence.

We can summarize the nature of the calculations involved in measuring the stock of capital in the following fashion:

$$1. \text{ Gross stock at the end of period} = \sum_{i=1}^L W_i I_{it}$$

where  $L$  = the assumed economic life of the capital asset,  $W_i = 1$  during the lifetime of the asset and  $I_{it}$  = the investment expenditures during each period. This assumption about the weight ( $W_i = 1$ ) is only one among many possibilities such as a distribution of weights derived from studies of the "survival curves" of individual pieces of equipment.

2. Net stock at the end of the period

$$= \sum_{i=1}^L W_i I_{it} d_i$$

where  $L$ ,  $W_i$  and  $I_{it}$  as before and

$$d_i = 1 - \frac{1}{L} T \quad (T = 0, 1, \dots, L - 1)$$

which indicates that the value of the asset declines linearly. Again this assumption is one among many alternatives. In recent years the diminishing balance system of depreciation has become increasingly popular.

It should be noted that the above stocks relate to the end of each calendar year and some minor adjustments are necessary to centre the estimates of the middle of each calendar year.

As mentioned before for certain industries alternative measures are available where alternative assumptions such as a bell-shaped distribution of weights and different depreciation functions have been used. It is hoped that in the near future a separate publication dealing with these alternative measures will become available.

## Brief Explanation of Terms

**Constant valuation** measures values in constant prices (1971).

**Current valuation** measures values in the prices of the given year.

**Depreciation** (capital consumption allowance) is the allowance made for physical deterioration and obsolescence.

**Discards** (retirements) are the value of gross investment that is withdrawn from the stock.

Nous pouvons résumer ainsi la nature des calculs entraînés par la mesure du stock de capital:

$$1. \text{ Le stock brut en fin de période est } = \sum_{i=1}^L W_i I_{it}$$

où  $L$  est la durée de vie présumée de l'actif, et  $I_{it}$  sont les dépenses d'investissement au cours de chaque période. L'hypothèse relative au coefficient de pondération ( $W_i = 1$ ) n'est qu'une des nombreuses possibilités, comme par exemple une distribution des coefficients de pondération obtenue à partir d'études des "courbes de survie" des différents éléments du matériel.

2. Le stock net en fin de période est

$$= \sum_{i=1}^L W_i I_{it} d_i$$

où  $L$ ,  $W_i$  et  $I_{it}$  ont la même signification que précédemment, et

$$d_i = 1 - \frac{1}{L} T \quad (T = 0, 1, \dots, L - 1)$$

ce qui signifie que la valeur de l'actif diminue de façon linéaire. Là encore, cette hypothèse n'est qu'une des nombreuses possibilités. Au cours des dernières années, le système d'amortissement par le solde décroissant s'est de plus en plus répandu.

Il est à noter que les stocks ci-dessus se rapportent à la fin de chaque année civile, et qu'il est nécessaire d'apporter quelques ajustements mineurs pour le centrage des estimations sur le milieu de l'année.

Comme on l'a mentionné précédemment dans le cas de certaines industries, on dispose d'autres mesures lorsque d'autres hypothèses, comme par exemple celles d'une distribution en cloche des coefficients de pondération et de différentes fonctions d'amortissement, ont été utilisées. On espère faire paraître dans un proche avenir une publication distincte qui leur sera consacrée.

## Brève explication des termes utilisés

**Évaluation constante:** mesure les valeurs en dollars constants de 1971.

**Évaluation courante:** mesure les valeurs aux prix de l'année en cours.

**Dépréciation** (provision pour consommation de capital): prise en compte de la dégradation physique et de l'obsolescence.

**Retraits:** valeur des investissements bruts retirés du stock.

**Gross fixed capital formation** (gross investment) is the value of new fixed capital goods purchased by the industries for which stock measurement is estimated. The data are obtained from Statistics Canada, *Private and Public Investment in Canada, Outlook*, Catalogue 61-205.

The investment expenditures are grouped by types of capital assets. Construction includes building construction and all types of engineering construction such as roads, dams, transmission lines and pipelines, as well as oil drilling and mine development. The machinery and equipment category takes into account the purchase of all such items which are used either in producing goods or providing services but does not cover durable goods purchased for personal use. Included, as well as industrial machinery, are transportation equipment, agricultural implements, professional and scientific equipment, office and store furnishings and other similar capital goods. Excluded, for the purpose of this report, are outlays for machinery and equipment by the Department of National Defence.

The breakdown of construction into building and engineering construction for the two most recent years has been imputed on the basis of an average disaggregation, as compiled according to the Private and Public Investment Survey. The following industries were surveyed directly: Mining, Air, Railway, Water, Motor and Urban Transport, Electric Power and Federal, Provincial and Municipal Governments.

**Gross stocks** are the cumulative value of gross investment in capital goods less cumulative discards.

**Mid-year gross and net stocks** are stocks adjusted to the middle of each year. Using the notations of Text Table I they are derived as follows:

$$\frac{K_n + K_{n-1}}{2} \text{ and } \frac{NK_n + NK_{n-1}}{2}$$

**Net stocks** are gross stocks less deductions of losses in value through physical deterioration and obsolescence.

**Service life** is the length of time during which capital assets are present in useful economic production before retirement occurs.

**Straight-line depreciation** for a capital asset is equal to its gross value divided by its service life.

**Formation brute de capital fixe** (investissement brut): valeur des nouveaux biens d'immobilisation acquis par les industries dont on estime le stock. Les données sont obtenues sur les *Investissements privés et publics au Canada, Perspectives*, Statistique Canada, n° 61-205 au catalogue.

Les dépenses d'investissement sont groupées par catégorie d'actifs de nature capitale. La construction comprend les bâtiments et tous les travaux de génie, comme les routes, les barrages, les lignes de transmission et les pipe-lines, ainsi que le forage de puits de pétrole et la mise en exploitation des mines. Dans le secteur des machines et de l'outillage, les achats comprennent tous les articles employés à la production de biens et de services mais non les biens durables achetés pour usage personnel. Sous cette rubrique sont inclus, en plus des machines industrielles, le matériel de transport, les instruments agricoles, le matériel professionnel et scientifique, les ameublements de bureaux et de magasins et autres biens capitaux du même genre. Toutefois, le présent rapport ne tient pas compte des montants consacrés à l'acquisition de machines et d'outillage par le Ministère de la Défense nationale.

La décomposition des données en bâtiment et travaux de génie pour les deux dernières années est dérivée à partir d'une moyenne des désaggrégations des données de l'enquête sur les investissements privés et publics au Canada. Les résultats pour les mines, le transport aérien, par chemin de fer, par eau, routier et urbain, l'énergie électrique et les gouvernements fédéral, provinciaux et municipaux sont basés sur une enquête directe.

**Stocks bruts:** valeur cumulative des investissements bruts en capital moins les retraits cumulatifs.

**Stocks bruts et nets du milieu de l'année:** stocks ajustés sur le milieu de chaque année. En utilisant les symboles du tableau explicatif I, on les calcule suivant les formules:

$$\frac{K_n + K_{n-1}}{2} \text{ et } \frac{NK_n + NK_{n-1}}{2}$$

**Stocks nets:** stocks bruts moins pertes de valeur en raison de la dégradation physique et de l'obsolescence.

**Durée de vie:** durée de la présence des actifs de nature capitale dans la production économique utile avant retrait.

**Amortissement linéaire:** dans le cas d'un actif de nature capitale, il est égal à la valeur brute de cet actif divisée par sa durée de vie.

TEXT TABLE III. CANSIM Matrix Numbers

TABLEAU EXPLICATIF III. Numéros de matrice CANSIM

1970 SIC industries	Current dollars	Constant 1971 dollars
CAÉ 1970 industries	En dollars courants	En dollars constants de 1971
	matrix numbers	
	numéro de matrice	
1 Total manufacturing and non-manufacturing industries (excluding housing) -- Ensemble des industries manufacturières et non-manufacturières (exclus domiciliaire)	3435	3487
2 Total manufacturing industries -- Ensemble des industries manufacturières	3436	3488
3 Food and beverage -- Aliments et boissons	3437	3489
4 Tobacco products -- Tabacs	3438	3490
5 Rubber and plastics products -- Industrie du caoutchouc et des produits en matière plastique	3439	3491
6 Leather -- Cuir	3440	3492
7 Textile -- Textiles	3441	3493
8 Knitting mills -- Bonneterie	3442	3494
9 Clothing -- Vêtements	3443	3495
10 Wood -- Bois	3444	3496
11 Furniture and fixtures -- Meubles et accessoires	3445	3497
12 Paper and allied industries -- Papiers et industries connexes	3446	3498
13 Printing, publishing and allied industries -- Impression, publication et industries connexes	3447	3499
14 Primary metals -- Métaux primaires	3448	3500
15 Metal fabricating -- Fabrications métalliques	3449	3501
16 Machinery -- Machines	3450	3502
17 Transportation equipment -- Matériel de transport	3451	3503
18 Electrical products -- Appareils et fournitures électriques	3452	3504
19 Non-metallic mineral products -- Produits des minéraux non métalliques	3453	3505
20 Petroleum and coal products -- Dérivés du pétrole et du charbon	3454	3506
21 Chemical and chemical products -- Produits chimiques	3455	3507
22 Miscellaneous manufacturing -- Industries diverses	3456	3508
23 Total non-manufacturing industries (excluding housing) -- Ensemble des industries non-manufacturières (exclus domiciliaire)	3457	3509
24 Agriculture	3458	3510
25 Forestry -- Activités forestières	3459	3511
26 Fishing -- Pêche	3460	3512
27 Mines, quarries and oil wells -- Mines, carrières et puits de pétrole	3461	3513
28 Construction	3462	3514
29 Air transport -- Transport aérien	3463	3515
30 Railway transport (including telegraph and cable systems) -- Transport par chemin de fer (compris réseaux télégraphe et câble)	3464	3516
31 Water transport -- Transport par eau et services	3465	3517
32 Motor transport -- Transport routier	3466	3518
33 Urban and suburban transport -- Transport urbain	3467	3519
34 Pipelines -- Oléoducs et gazoducs	3468	3520
35 Toll highways, bridges and warehousing -- Routes et ponts à péage et entreposage	3469	3521
36 Grain elevators -- Silos à céréales	3470	3522
37 Broadcasting -- Radiodiffusion	3472	3524
38 Telephones (excluding telegraphs) -- Services téléphoniques (exclus télégraphe)	3473	3525
39 Electric power and gas distribution -- Énergie électrique et distribution du gaz	3474	3526
40 Water systems -- Services de distribution d'eau	3475	3527
41 Trade -- Commerce	3476	3528
42 Finance, insurance and real estate -- Finances, assurances et immeubles	3477	3529
43 Schools -- Ecoles	3478	3530
44 Universities -- Universités	3479	3531
45 Hospitals -- Hôpitaux	3480	3532
46 Churches -- Églises	3481	3533
47 Other institutions -- Autres institutions	3482	3534
48 Commercial services -- Services commerciaux	3483	3535
49 Federal government -- Gouvernement fédéral	3484	3536
50 Provincial governments -- Gouvernements provinciaux	3485	3537
51 Municipal governments -- Gouvernements municipaux	3486	3538

Note: To order any data from CANSIM on magnetic tape or computer printouts, contact General Time Series Staff, Statistics Canada, Ottawa, K1A 0Z8.

Nota: Pour commander toute série de données du système CANSIM sur bande magnétique ou imprimés d'ordinateur, s'adresser au Service des séries chronologiques générales, Statistique Canada, Ottawa, K1A 0Z8.

Fixed Capital Flows and Stocks,  
Manufacturing and Non-  
manufacturing Industries

Flux et stocks de capital fixe,  
industries manufacturières  
et non-manufacturières

**Total Manufacturing and Non-manufacturing Industries (Excluding Housing)**  
**Ensemble des industries manufacturières et non-manufacturières (exclus domiciliaire)**

Year Année	Gross fixed capital formation - Formation brute de capital fixe	Net fixed capital formation - Formation nette de capital fixe	Capital consumption allowances - Provisions pour consommation de capital	Mid-year gross stock - Stock brut de mi-année	Mid-year net stock - Stock net de mi-année	Gross fixed capital formation - Formation brute de capital fixe	Net fixed capital formation - Formation nette de capital fixe	Capital consumption allowances - Provisions pour consommation de capital	Mid-year gross stock - Stock brut de mi-année	Mid-year net stock - Stock net de mi-année

1982	1,676.4	138.0	1,538.4	7,691.4	4,001.5	554.2	45.7	508.9	2,543.3	1,323.2

The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.  
 Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

**Total Manufacturing Industries**  
**Ensemble des industries manufacturières**

## Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

## How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

National Wealth and Capital Stock Section,  
Construction Division,

Statistics Canada, Ottawa, K1A 9Z9 (Telephone: 995-8152) or to the Statistics Canada reference centre in:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (992-4734)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Toll-free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional reference centres.

Newfoundland and Labrador	Zénith 0-7037
Nova Scotia, New Brunswick and Prince Edward Island	1-800-565-7192
Quebec	1-800-361-2831
Ontario	1-800-268-1151
Manitoba	1-800-282-8006
Saskatchewan	1(112)800-667-3524
Alberta	1-800-222-6400
British Columbia (South and Central)	112-800-663-1551
Yukon and Northern B.C. (area served by Northwestel Inc.)	Zénith 0-8913
Northwest Territories (area served by Northwestel Inc.)	Zénith 2-2015

## How to Order Publications

This and other Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the local Statistics Canada offices, or by mail order to Publication Sales and Services, Statistics Canada, Ottawa, K1A 0V7.

## Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordiolingue et le système d'extraction de Statistique Canada.

## Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section de la richesse nationale et des stocks de capital,  
Division de la construction,

Statistique Canada, Ottawa, K1A 9Z9 (téléphone: 995-8152) ou au centre de consultation de Statistique Canada à:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (992-4734)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Un service d'appel interurbain sans frais est offert, dans toutes les provinces et dans les territoires, aux utilisateurs qui habitent à l'extérieur des zones de communication locale des centres régionaux de consultation.

## SYMBOLS

The following standard symbols are used in Statistics Canada publications:

- .. figures not available.
- ... figures not appropriate or not applicable.
- nil or zero.
- amount too small to be expressed.
- P preliminary figures.
- r revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.

### **NOTE ON CANSIM**

CANSIM (Canadian Socio-Economic Information Management System) is Statistics Canada's computerized data bank and its supporting software. Most of the data appearing in this publication, as well as historical data are available from CANSIM via terminal, on computer printouts, or in machine readable form. Matrix numbers are given in Text Table III.

For further information write to CANSIM Division, Statistics Canada, Ottawa, K1A 9Z9 or telephone (613) 995-7406.

## SIGNES CONVENTIONNELS

Les signes conventionnels suivants sont employés uniformément dans les publications de Statistique Canada:

- .. nombres indisponibles.
- ... n'ayant pas lieu de figurer.
- néant ou zéro.
- nombres infimes.
- P nombres provisoires.
- r nombres rectifiés.
- x confidentiel en vertu des dispositions de la Loi sur la statistique relatives au secret.

### **NOTE CONCERNANT CANSIM**

Le CANSIM (Système canadien d'information socio-économique) est le système de Statistique Canada qui se compose d'une banque de données informatisées et de son logiciel de soutien. La plupart des données présentées dans cette publication ainsi que des données historiques peuvent être extraites du CANSIM par l'intermédiaire d'un terminal, sous forme d'imprimées d'ordinateur ou sous forme lisible par machine. Les numéros de matrice apparaissent au tableau explicatif III.

Pour plus de renseignements écrivez à la Division CANSIM Statistique Canada, Ottawa, K1A 9Z9 ou téléphonez à (613) 995-7406.

## INTRODUCTION

The procedures and problems associated with the estimates of capital stocks are fully described in Catalogue 13-522. The purpose of this introduction is to present a brief outline of the basic methodology underlying the capital flow and stock data presented in this report.

Capital stocks in existence are traditionally considered one among several factors of production. The measurement of capital in both theoretical and technical formulations is closely related to investment to the extent that a certain technical link between the two concepts and definitions (stocks, flows) has to be established before any elaboration can be made in the direction of capital measurement.

Traditionally, the relationship between the capital stock and the corresponding flow of capital services is one of proportionality. This assumption implies that the services of capital goods acquired at different points in time are perfect substitutes in production. From this substitutability over time stems the property of proportionality between the capital services from each capital good and the stock of capital as measured by adding together all past investment acquisitions.

There is a substantial literature, both theoretical and technical, relating to the measurement of capital. Among a number of methods the "Perpetual Inventory" method is generally preferred primarily because of its malleability in the creation of time series of capital stocks.

Briefly, this method involves the accumulation over a period of years of investment expenditures by industry to obtain its capital stock in any given year.

The basic ingredients required are:

- annual investment series, broken down by industry and category of expenditure,
- price deflators relating to the investment series,
- estimates of average economic lives of the assets used in the various industries.

Les méthodes et problèmes associés aux estimations des stocks de capital sont décrits au complet dans le n° 13-522 au catalogue. La présente introduction vise à décrire brièvement la méthodologie à la base des données sur les stocks et flux de capital présentées dans cette publication.

Les stocks de capital existants ont toujours été considérés comme l'un des facteurs de production. La mesure du capital tant du point de vue théorique que pratique est étroitement liée aux investissements, dans la mesure où il faut établir un certain lien technique entre les deux concepts et définitions (stocks, flux) avant de pouvoir progresser dans la mesure du capital.

La relation entre le stock de capital et le flux correspondant de services de nature capitale a toujours été une relation de proportionnalité. Ce postulat implique que les services des biens de capital acquis à différents moments sont des substituts parfaits dans la production. De cette notion de possibilité de substitution dans le temps découle celle de proportionnalité entre les services de nature capitale provenant de chaque bien de capital et le stock de capital, mesuré par la somme de toutes les acquisitions faites grâce aux investissements.

Un nombre appréciable d'auteurs se sont penchés sur la mesure du capital à la fois du point de vue théorique et du point de vue pratique. Parmi les diverses méthodes existantes, on préfère généralement celle de "L'inventaire perpétuel" avant tout pour sa souplesse lors de la création de séries chronologiques de stocks de capital.

En bref, il s'agit d'accumuler pendant un certain nombre d'années les dépenses d'investissements de l'industrie pour obtenir son stock de capital pour une année donnée.

Les éléments fondamentaux nécessaires sont:

- les séries annuelles des investissements, par industrie et catégorie de dépense,
- les indices de déflation se rapportant aux séries sur les investissements,
- les estimations de la durée de vie économique moyenne des actifs utilisés par les diverses industries.

The reliability of the capital stocks series thus generated depends of course on the quality, of the investment data being cumulated, and on the realism of both the service life assumption and the method by which capital assets are considered to depreciate over their service life.

As an aid to a better understanding of the mechanics of the "Perpetual Inventory" method, an illustration of the actual computing process is given. Assume that the capital assets in a particular industry remain in production 10 years before they are retired.

Investment expenditures pertaining to the types of capital assets in question, adjusted for prices, are cumulated for a period of 10 years. In the tenth year a measure of the gross stock of this industry's capital assets is obtained. In the eleventh year the investment expenditures of the first year are deducted from the cumulated total while the purchases of capital assets of the new year are added. We proceed in the same manner for all subsequent years.

In the **gross capital stocks**, capital assets are included at their full value during the entire time they remain in the capital stock. In other words, the deductions from gross investment are due to the fact that assets in question have ceased to exist. An alternative set of measures of capital stocks is derived by adjusting the value of the assets in existence for the wear and tear and obsolescence they undergo during their service life: these estimates are known as **net capital stocks**. Calculations of net capital stocks are made by applying a depreciation formula to the gross stock estimates. The **net stocks** presented in this report have been prepared by means of using the "straight-line" method. The net stock is always equal to the difference between the cumulative value of past gross investment and cumulative depreciation. Text Table I summarizes an exemplary illustration of the computational procedure involved in the "Perpetual Inventory" method. Text Table II shows the industries for which capital flow and stock estimates are presented in this volume together with the types of assets and their service lives.

In the context of the "Perpetual Inventory" method, the value of the capital stock can also be viewed as the weighted sum of past gross investment expenditures. The weights used can be thought of as the resultant of two factors. The first factor relates to the mortality of an asset, namely the probability that the assets of a certain age are in existence when the stock is being estimated. In other words this factor relates to the depreciation in the sense of physical decay, retirement, etc.

La fiabilité des séries de stock de capital ainsi produites dépend naturellement de la qualité des données sur les investissements qui ont été réunies, du réalisme à la fois de l'hypothèse de durée de vie et de la méthode que l'on a retenue pour la dépréciation des actifs de nature capitale tout au long de leur vie utile.

Afin de mieux faire saisir le mécanisme de la méthode de "L'inventaire perpétuel", le lecteur trouvera ci-après une illustration du processus réel de calcul. Supposons que les actifs de nature capitale d'une industrie donnée demeurent en production 10 ans avant d'être retirés.

Les dépenses d'investissement se rapportant aux catégories d'actifs de capital considérées, après déflation, sont sommées sur une période de 10 ans. La dixième année, on obtient une mesure du stock brut des actifs de capital de cette industrie. La onzième année, on déduit les dépenses d'investissement de la première année du total cumulatif, et on ajoute les achats de nature capitale au cours de la nouvelle année. On procède ainsi de la même manière pour toutes les années suivantes.

On regroupe dans les **stocks bruts de capital** les actifs de nature capital à leur valeur intégrale tant que ces actifs font partie du stock de capital. En d'autres termes, les déductions sur les investissements bruts s'expliquent par le fait que les actifs en question ont cessé d'exister. On obtient un autre ensemble de mesures des stocks de capital en ajustant la valeur des actifs existants pour prendre en compte l'usure et l'obsolescence qu'ils subissent lors de leur durée de vie, et l'on appelle ces estimations **stocks nets de capital**. On calcule les stocks nets de capital grâce à une formule d'amortissement que l'on fait intervenir dans les estimations des stocks bruts. Les **stocks nets** indiqués dans la présente publication ont été calculés grâce à la méthode dite "linéaire". Le stock net est toujours égal à la différence entre la valeur cumulative des investissements bruts antérieurs et la dépréciation accumulée. On trouvera au tableau explicatif I un exemple récapitulatif de la méthode de calcul utilisée dans la méthode de "L'inventaire perpétuel". Le tableau explicatif II présente les industries dont les estimations des flux et stocks de capital figurent dans le présent ouvrage, ainsi que les différentes catégories d'actifs et leurs durées de vie.

Dans le cadre de la méthode de "L'inventaire perpétuel", on peut aussi considérer la valeur du stock de capital comme la somme pondérée des dépenses d'investissement brutes antérieures. Les coefficients de pondération utilisés peuvent être considérés comme le résultat de deux facteurs. Le premier de ces facteurs se rapporte à la disparition d'un actif, c'est-à-dire à la probabilité que les actifs d'un certain âge existent encore lors de l'estimation du stock. En d'autres termes, ce facteur se rapporte à la dépréciation, dans le sens de dégradation physique, de retrait, etc.

The second factor deals with the value of the assets still present in the stock. If the items included in the stock retain their original value then we are measuring the gross stock: if their value is diminishing over their service life then we are measuring the net stocks where allowances have been made for wear and tear and obsolescence.

We can summarize the nature of the calculations involved in measuring the stock of capital in the following fashion:

1. Gross stock at the end of period =

$$\sum_{i=1}^L W_i I_{it}$$

where  $L$  = the assumed economic life of the capital asset,  $W_i = 1$  during the lifetime of the asset and  $I_{it}$  = the investment expenditures during each period. This assumption about the weight ( $W_i = 1$ ) is only one among many possibilities such as a distribution of weights derived from studies of the "survival curves" of individual pieces of equipment.

2. Net stock at the end of the period

$$= \sum_{i=1}^L W_i I_{it} d_i$$

where  $L$ ,  $W_i$  and  $I_{it}$  are defined as before and

$$d_i = 1 - \frac{1}{L} T \quad (T = 0, 1, \dots, L-1)$$

which indicates that the value of the asset declines linearly. Again, this assumption is one among many alternatives. In recent years the diminishing balance system of depreciation has become increasingly popular.

It should be noted that the above stocks relate to the end of each calendar year and some minor adjustments are necessary to centre the estimates to the middle of each calendar year.

As mentioned before, for certain industries alternative measures are available where alternative assumptions such as bell-shaped distribution of weights and different depreciation functions have been used. It is hoped that in the near future a separate publication dealing with these alternative measures will become available.

Residential capital stock includes all non-collective dwellings, private and

Le second facteur a trait à la valeur des actifs faisant encore partie du stock. Si les éléments du stock conservent leur valeur originale, nous mesurons alors le stock brut: si leur valeur diminue tout au long de leur durée de vie, nous mesurons alors les stocks nets, après avoir pris en compte l'usure et l'obsolescence.

Nous pouvons résumer ainsi la nature des calculs entraînés par la mesure du stock de capital:

1. Le stock brut en fin de période est =

$$\sum_{i=1}^L W_i I_{it}$$

où  $L$  est la durée de vie présumée de l'actif, et  $I_{it}$  sont les dépenses d'investissement au cours de chaque période. L'hypothèse relative au coefficient de pondération ( $W_i = 1$ ) n'est qu'une des nombreuses possibilités, comme par exemple une distribution des coefficients de pondération obtenue à partir d'études des "courbes de survie" des différents éléments du matériel.

2. Le stock net en fin de période est

$$= \sum_{i=1}^L W_i I_{it} d_i$$

où  $L$ ,  $W_i$  et  $I_{it}$  ont la même signification que précédemment, et

$$d_i = 1 - \frac{1}{L} T \quad (T = 0, 1, \dots, L-1)$$

ce qui signifie que la valeur de l'actif diminue de façon linéaire. Là encore, cette hypothèse n'est qu'une des nombreuses possibilités. Au cours des dernières années, le système d'amortissement par le solde décroissant s'est de plus en plus répandu.

Il est à noter que les stocks ci-dessus se rapportent à la fin de chaque année civile, et qu'il est nécessaire d'apporter quelques ajustements mineurs pour le centrage des estimations sur le milieu de l'année.

Comme on l'a mentionné précédemment dans le cas de certaines industries, on dispose d'autres mesures lorsque d'autres hypothèses, comme par exemple celles d'une distribution en cloche des coefficients de pondération et de différentes fonctions d'amortissement, ont été utilisées. On espère faire paraître dans un proche avenir une publication distincte qui leur sera consacrée.

Le stock de capital domiciliaire inclut tous les logements non-collectifs, privés ou publics,

public, mobile homes and conventionally built structures. It includes the related items, non-movable equipment installed in residential buildings, outbuildings such as garages, swimming pools, sheds, etc. Expenditures for major alterations and improvements are also capitalized.

As in the case of non-residential capital stock series, the perpetual inventory method is utilized in deriving residential capital stock estimates. However, the value of discarded assets and the depreciation function employed are different. The value of discards or dwellings demolished is estimated using information derived from the Building Permit Survey and the annual report of the Fire Commissioner of Canada rather than a mortality pattern based on an average expected life of dwellings.

While the non-residential net capital stock estimate results from the application of a linear depreciation function, residential net capital stock is estimated using the declining balance pattern (exponential function) which assumes that annual depreciation changes equal a fixed percentage of the net value of the asset at the beginning of the year. The depreciation rate actually used is 2% a year for all types of dwellings. There is no general agreement as to the correct method of computing depreciation but geometric decay of productive capacity of residential stock is a commonly employed assumption in studies done in Canada and abroad.

#### Brief Explanation of Terms

**Constant valuation** measures values in constant prices (1971).

**Current valuation** measures values in the prices of the given year.

**Depreciation** (capital consumption allowance) is the allowance made for physical deterioration and obsolescence.

**Discards** (retirements) are the value of gross investment that is withdrawn from the stock.

**Gross fixed capital formation** (gross investment) is the value of new fixed capital goods purchased by the industries for which stock measurement is estimated. The data are obtained from Statistics Canada, *Private and Public Investment in Canada, Outlook*, Catalogue 61-205.

de type conventionnel ou mobile. Il comprend aussi tous les éléments auxiliaires, tel que l'équipement permanent à l'intérieur du logement ainsi que les constructions connexes telles que garages, piscines, remises, etc. Les dépenses pour les travaux de rénovation ou d'amélioration sont aussi incluses.

La technique d'estimation du stock de capital domiciliaire est essentiellement la même que celle utilisée pour l'estimation du stock non-domiciliaire à savoir celle de l'inventaire permanent. Cependant, elle diffère de cette dernière quant aux hypothèses retenues pour le calcul de la disparition et de la dépréciation des actifs. La valeur des logements démolis est calculée à partir de données fournies par l'enquête sur les permis de bâtir et le rapport annuel du commissaire des incendies du Canada, plutôt qu'une fonction de disparition basée sur la vie moyenne des logements.

Alors que la fonction de dépréciation utilisée lors de l'estimation du stock non-domiciliaire est de type linéaire, la fonction retenue pour le calcul du stock domiciliaire net est une fonction géométrique ou à solde décroissant. Celle-ci implique que le montant de dépréciation annuelle est un pourcentage fixe de la valeur nette de l'actif au début de l'année. Un taux de dépréciation de 2% est utilisé pour chacun des types de logement. Bien qu'il n'y ait pas de consensus sur la meilleure méthode de calcul de la dépréciation à employer, la décroissante géométrique de la capacité productive du stock de capital domiciliaire est l'une des hypothèses la plus couramment utilisée dans les travaux réalisés tant au Canada qu'à l'étranger.

#### Brève explication des termes utilisés

**Évaluation constante:** mesure les valeurs en dollars constants de 1971.

**Évaluation courante:** mesure les valeurs aux prix de l'année en cours.

**Dépréciation** (provision pour consommation de capital): prise en compte de la dégradation physique et de l'obsolescence.

**Retraits:** valeur des investissements bruts retirés du stock.

**Formation brute de capital fixe** (investissement brut): valeur des nouveaux biens d'immobilisation acquis par les industries dont on estime le stock. Les données sont obtenues à partir de *Investissements privés et publics au Canada, Perspectives*, Statistique Canada, n° 61-205 au catalogue.

The investment expenditures are grouped by types of capital assets. Construction includes building construction and all types of engineering construction such as roads, dams, transmission lines and pipelines, as well as oil drilling and mine development. The machinery and equipment category takes into account the purchase of all such items which are used either in producing goods or providing services but does not cover durable goods purchased for personal use. Included, as well as industrial machinery, are transportation equipment, agricultural implements, professional and scientific equipment, office and store furnishings and other similar capital goods. Excluded, for the purpose of this report, are outlays for machinery and equipment by the Department of National Defence.

The breakdown of construction into building and engineering construction for the two most recent years has been imputed on the basis of an average disaggregation, as compiled according to the Private and Public Investment Survey. The following industries were surveyed directly: mining, transport industries, (air, railway, water, motor and urban), electric power and federal, provincial and municipal governments.

**Gross stocks** are the cumulative value of gross investment in capital goods less cumulative discards.

**Mid-year gross and net stocks** are stocks adjusted to the middle of each year. Using the notations of Text Table I they are derived as follows:

$$\frac{K_n + K_{n-1}}{2} \text{ and } \frac{N^K_n + N^K_{n-1}}{2}$$

**Net stocks** are gross stocks less deductions of losses in value through physical deterioration and obsolescence.

**Service life** is the length of time during which capital assets are present in useful economic production before retirement occurs.

**Straight-line depreciation** for a capital asset is equal to its gross value divided by its service life.

Les dépenses d'investissement sont groupées par catégorie d'actifs de nature capitale. La construction comprend les bâtiments et tous les travaux de génie, comme les routes, les barrages, les lignes de transmission et les pipe-lines, ainsi que le forage de puits de pétrole et la mise en exploitation des mines. Dans le secteur des machines et de l'outillage, les achats comprennent tous les articles employés à la production de biens et de services mais non les biens durables achetés pour usage personnel. Sous cette rubrique sont inclus, en plus des machines industrielles, le matériel de transport, les instruments agricoles, le matériel professionnel et scientifique, les ameublements de bureaux et de magasins et autres biens capitaux du même genre. Toutefois, le présent rapport ne tient pas compte des montants consacrés à l'acquisition de machines et d'outillage par le Ministère de la Défense nationale.

La décomposition des données en bâtiment et travaux de génie pour les deux dernières années est dérivée à partir d'une moyenne des désaggrégations des données de l'enquête sur les investissements privés et publics au Canada. Les résultats pour les mines, le transport aérien, par chemin de fer, par eau, routier et urbain, l'énergie électrique et les gouvernements fédéral, provinciaux et municipaux sont basés sur une enquête directe.

**Stocks bruts:** valeur cumulative des investissements bruts en capital moins les retraits cumulatifs.

**Stocks bruts et nets du milieu de l'année:** stocks ajustés sur le milieu de chaque année. En utilisant les symboles du tableau explicatif I, on les calcule suivant les formules:

$$\frac{K_n + K_{n-1}}{2} \text{ et } \frac{N^K_n + N^K_{n-1}}{2}$$

**Stocks nets:** stocks bruts moins pertes de valeur en raison de la dégradation physique et de l'obsolescence.

**Durée de vie:** durée de la présence des actifs de nature capitale dans la production économique utile avant retrait.

**Amortissement linéaire:** dans le cas d'un actif de nature capitale, il est égale à la valeur brute de cet actif divisée par sa durée de vie.

TEXT TABLE I. Example: Assumed Service Life = 10 Years = L

TABLEAU EXPLICATIF I. Exemple: Durée de vie supposée de 10 ans = L

1983	4,353.0	2,175.3	150,005.0	147,946.0	95,810.1	94,721.3	

1. The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

2. The price index is the implicit price index of residential construction.

L'indice de prix est l'indice implicite de prix de la construction domiciliaire.

## LIST OF RELATED PUBLICATIONS

### Catalogue

#### Occasional

- 13-522 Fixed Capital Flows and Stocks, Manufacturing, Canada, 1926-1960: Methodology. 1967. English.
- 13-568 Fixed Capital Flows and Stocks, Historical, Bilingual.
- 62-552 Machinery and Equipment Price Indexes by Industry of Purchase, 1971-1979, Bilingual.

#### Annual

- 61-205 Private and Public Investment in Canada, Outlook. Bilingual.
- 61-206 Private and Public Investment in Canada, Mid-Year Review. Bilingual.

In addition to the selected publications listed above, Statistics Canada publishes a wide range of statistical reports on Canadian economic and social affairs. A comprehensive catalogue of all current publications is available free on request from Statistics Canada, Ottawa (Canada), K1A 9Z9.

## Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

## How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

National Wealth and Capital Stock Section,  
Construction Division,

Statistics Canada, Ottawa, K1A 0T6 (Telephone: 990-9684) or to the Statistics Canada reference centre in:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (990-8116)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Toll-free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional reference centres.

Newfoundland and Labrador	Zenith 0-7037
Nova Scotia, New Brunswick and Prince Edward Island	1-800-565-7192
Quebec	1-800-361-2831
Ontario	1-800-268-1151
Manitoba	1-800-282-8006
Saskatchewan	1(112)800-667-3524
Alberta	1-800-222-6400
British Columbia (South and Central)	112-800-663-1551
Yukon and Northern B.C. (area served by NorthwTel Inc.)	Zenith 0-8913
Northwest Territories (area served by NorthwTel Inc.)	Zenith 2-2015

## How to Order Publications

This and other Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the local Statistics Canada offices, or by mail order to Publication Sales and Services, Statistics Canada, Ottawa, K1A 0T6.

## Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordiolingue et le système d'extraction de Statistique Canada.

## Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section de la richesse nationale et des stocks de capital,  
Division de la construction,

Statistique Canada, Ottawa, K1A 0T6 (téléphone: 990-9684) ou au centre de consultation de Statistique Canada à:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (990-8116)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Un service d'appel interurbain sans frais est offert, dans toutes les provinces et dans les territoires, aux **utilisateurs qui habitent à l'extérieur des zones de communication locale** des centres régionaux de consultation.

The following standard symbols are used in Statistics Canada publications:

- .. figures not available.
- ... figures not appropriate or not applicable.
- nil or zero.
- amount too small to be expressed.
- P preliminary figures.
- r revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.

### NOTE ON CANSIM

CANSIM (Canadian Socio-Economic Information Management System) is Statistics Canada's computerized data bank and its supporting software. Most of the data appearing in this publication, as well as historical data are available from CANSIM via terminal, on computer printouts, or in machine readable form. Matrix numbers are given in Text Table III.

For further information write to CANSIM Division, Statistics Canada, Ottawa, K1A 9Z9 or telephone (613) 995-7406.

## SIGNES CONVENTIONNELS

Les signes conventionnels suivants sont employés uniformément dans les publications de Statistique Canada:

- .. nombres indisponibles.
- ... n'ayant pas lieu de figurer.
- néant ou zéro.
- nombres infimes.
- P nombres provisoires.
- r nombres rectifiés.

x confidentiel en vertu des dispositions de la Loi sur la statistique relatives au secret.

### NOTE CONCERNANT CANSIM

Le CANSIM (Système canadien d'information socio-économique) est le système de Statistique Canada qui se compose d'une banque de données informatisées et de son logiciel de soutien. La plupart des données présentées dans cette publication ainsi que des données historiques peuvent être extraites du CANSIM par l'intermédiaire d'un terminal, sous forme d'imprimées d'ordinateur ou sous forme lisible par machine. Les numéros de matrice apparaissent au tableau explicatif III.

Pour plus de renseignements écrivez à la Division CANSIM Statistique Canada, Ottawa, K1A 9Z9 ou téléphonez à (613) 995-7406.

## INTRODUCTION

The procedures and problems associated with the estimates of capital stocks are fully described in Catalogue 13-522. The purpose of this introduction is to present a brief outline of the basic methodology underlying the capital flow and stock data presented in this report.

Capital stocks in existence are traditionally considered one among several factors of production. The measurement of capital in both theoretical and technical formulations is closely related to investment to the extent that a certain technical link between the two concepts and definitions (stocks, flows) has to be established before any elaboration can be made in the direction of capital measurement.

Traditionally, the relationship between the capital stock and the corresponding flow of capital services is one of proportionality. This assumption implies that the services of capital goods acquired at different points in time are perfect substitutes in production. From this substitutability over time stems the property of proportionality between the capital services from each capital good and the stock of capital as measured by adding together all past investment acquisitions.

There is a substantial literature, both theoretical and technical, relating to the measurement of capital. Among a number of methods the "Perpetual Inventory" method is generally preferred primarily because of its malleability in the creation of time series of capital stocks.

Briefly, this method involves the accumulation over a period of years of investment expenditures by industry to obtain its capital stock in any given year.

The basic ingredients required are:

- annual investment series, broken down by industry and category of expenditure,
- price deflators relating to the investment series,
- estimates of average economic lives of the assets used in the various industries.

Les méthodes et problèmes associés aux estimations des stocks de capital sont décrits au complet dans le n° 13-522 au catalogue. La présente introduction vise à décrire brièvement la méthodologie à la base des données sur les stocks et flux de capital présentées dans cette publication.

Les stocks de capital existants ont toujours été considérés comme l'un des facteurs de production. La mesure du capital tant du point de vue théorique que pratique est étroitement liée aux investissements, dans la mesure où il faut établir un certain lien technique entre les deux concepts et définitions (stocks, flux) avant de pouvoir progresser dans la mesure du capital.

La relation entre le stock de capital et le flux correspondant de services de nature capitale a toujours été une relation de proportionnalité. Ce postulat implique que les services des biens de capital acquis à différents moments sont des substituts parfaits dans la production. De cette notion de possibilité de substitution dans le temps découle celle de proportionnalité entre les services de nature capitale provenant de chaque bien de capital et le stock de capital, mesuré par la somme de toutes les acquisitions faites grâce aux investissements.

Un nombre appréciable d'auteurs se sont penchés sur la mesure du capital à la fois du point de vue théorique et du point de vue pratique. Parmi les diverses méthodes existantes, on préfère généralement celle de "L'inventaire perpétuel" avant tout pour sa souplesse lors de la création de séries chronologiques de stocks de capital.

En bref, il s'agit d'accumuler pendant un certain nombre d'années les dépenses d'investissements de l'industrie pour obtenir son stock de capital pour une année donnée.

Les éléments fondamentaux nécessaires sont:

- les séries annuelles des investissements, par industrie et catégorie de dépense,
- les indices de déflation se rapportant aux séries sur les investissements,
- les estimations de la durée de vie économique moyenne des actifs utilisés par les diverses industries.

The reliability of the capital stocks series thus generated depends of course on the quality, of the investment data being cumulated, and on the realism of both the service life assumption and the method by which capital assets are considered to depreciate over their service life.

As an aid to a better understanding of the mechanics of the "Perpetual Inventory" method, an illustration of the actual computing process is given. Assume that the capital assets in a particular industry remain in production 10 years before they are retired.

Investment expenditures pertaining to the types of capital assets in question, adjusted for prices, are cumulated for a period of 10 years. In the tenth year a measure of the gross stock of this industry's capital assets is obtained. In the eleventh year the investment expenditures of the first year are deducted from the cumulated total while the purchases of capital assets of the new year are added. We proceed in the same manner for all subsequent years.

In the **gross capital stocks**, capital assets are included at their full value during the entire time they remain in the capital stock. In other words, the deductions from gross investment are due to the fact that assets in question have ceased to exist. An alternative set of measures of capital stocks is derived by adjusting the value of the assets in existence for the wear and tear and obsolescence they undergo during their service life; these estimates are known as **net capital stocks**. Calculations of net capital stocks are made by applying a depreciation formula to the gross stock estimates. The **net stocks** presented in this report have been prepared by means of using the "straight-line" method. The net stock is always equal to the difference between the cumulative value of past gross investment and cumulative depreciation. Text Table I summarizes an exemplary illustration of the computational procedure involved in the "Perpetual Inventory" method. Text Table II shows the industries for which capital flow and stock estimates are presented in this volume together with the types of assets and their service lives.

In the context of the "Perpetual Inventory" method, the value of the capital stock can also be viewed as the weighted sum of past gross investment expenditures. The weights used can be thought of as the resultant of two factors. The first factor relates to the mortality of an asset, namely the probability that the assets of a certain age are in existence when the stock is being estimated. In other words this factor relates to the depreciation in the sense of physical decay, retirement, etc.

La fiabilité des séries de stock de capital ainsi produites dépend naturellement de la qualité des données sur les investissements qui ont été réunies, du réalisme à la fois de l'hypothèse de durée de vie et de la méthode que l'on a retenue pour la dépréciation des actifs de nature capitale tout au long de leur vie utile.

Afin de mieux faire saisir le mécanisme de la méthode de "L'inventaire perpétuel", le lecteur trouvera ci-après une illustration du processus réel de calcul. Supposons que les actifs de nature capitale d'une industrie donnée demeurent en production 10 ans avant d'être retirés.

Les dépenses d'investissement se rapportant aux catégories d'actifs de capital considérées, après déflation, sont sommées sur une période de 10 ans. La dixième année, on obtient une mesure du stock brut des actifs de capital de cette industrie. La onzième année, on déduit les dépenses d'investissement de la première année du total cumulé, et on ajoute les achats de nature capitale au cours de la nouvelle année. On procède ainsi de la même manière pour toutes les années suivantes.

On regroupe dans les **stocks bruts de capital** les actifs de nature capital à leur valeur intégrale tant que ces actifs font partie du stock de capital. En d'autres termes, les déductions sur les investissements bruts s'expliquent par le fait que les actifs en question ont cessé d'exister. On obtient un autre ensemble de mesures des stocks de capital en ajustant la valeur des actifs existants pour prendre en compte l'usure et l'obsolescence qu'ils subissent lors de leur durée de vie, et l'on appelle ces estimations **stocks nets de capital**. On calcule les stocks nets de capital grâce à une formule d'amortissement que l'on fait intervenir dans les estimations des stocks bruts. Les **stocks nets** indiqués dans la présente publication ont été calculés grâce à la méthode dite "linéaire". Le stock net est toujours égal à la différence entre la valeur cumulative des investissements bruts antérieurs et la dépréciation accumulée. On trouvera au tableau explicatif I un exemple récapitulatif de la méthode de calcul utilisée dans la méthode de "L'inventaire perpétuel". Le tableau explicatif II présente les industries dont les estimations des flux et stocks de capital figurent dans le présent ouvrage, ainsi que les différentes catégories d'actifs et leurs durées de vie.

Dans le cadre de la méthode de "L'inventaire perpétuel", on peut aussi considérer la valeur du stock de capital comme la somme pondérée des dépenses d'investissement brutes antérieures. Les coefficients de pondération utilisés peuvent être considérés comme le résultat de deux facteurs. Le premier de ces facteurs se rapporte à la disparition d'un actif, c'est-à-dire à la probabilité que les actifs d'un certain âge existent encore lors de l'estimation du stock. En d'autres termes, ce facteur se rapporte à la dépréciation, dans le sens de dégradation physique, de retrait, etc.

The second factor deals with the value of the assets still present in the stock. If the items included in the stock retain their original value then we are measuring the gross stock; if their value is diminishing over their service life then we are measuring the net stocks where allowances have been made for wear and tear and obsolescence.

We can summarize the nature of the calculations involved in measuring the stock of capital in the following fashion:

1. Gross stock at the end of period =

$$\sum_{i=1}^L W_i I_{it}$$

where  $L$  = the assumed economic life of the capital asset,  $W_i = 1$  during the lifetime of the asset and  $I_{it}$  = the investment expenditures during each period. This assumption about the weight ( $W_i = 1$ ) is only one among many possibilities such as a distribution of weights derived from studies of the "survival curves" of individual pieces of equipment.

2. Net stock at the end of the period

$$= \sum_{i=1}^L W_i I_{it} d_i$$

where  $L$ ,  $W_i$  and  $I_{it}$  are defined as before and

$$d_i = 1 - \frac{1}{L} T \quad (T = 0, 1, \dots, L - 1)$$

which indicates that the value of the asset declines linearly. Again, this assumption is one among many alternatives. In recent years the diminishing balance system of depreciation has become increasingly popular.

It should be noted that the above stocks relate to the end of each calendar year and some minor adjustments are necessary to centre the estimates to the middle of each calendar year.

As mentioned before, for certain industries alternative measures are available where alternative assumptions such as bell-shaped distribution of weights and different depreciation functions have been used. It is hoped that in the near future a separate publication dealing with these alternative measures will become available.

Residential capital stock includes all non-collective dwellings, private and

Le second facteur a trait à la valeur des actifs faisant encore partie du stock. Si les éléments du stock conservent leur valeur originale, nous mesurons alors le stock brut; si leur valeur diminue tout au long de leur durée de vie, nous mesurons alors les stocks nets, après avoir pris en compte l'usure et l'obsolescence.

Nous pouvons résumer ainsi la nature des calculs entraînés par la mesure du stock de capital:

1. Le stock brut en fin de période est =

$$\sum_{i=1}^L W_i I_{it}$$

où  $L$  est la durée de vie présumée de l'actif, et  $I_{it}$  sont les dépenses d'investissement au cours de chaque période. L'hypothèse relative au coefficient de pondération ( $W_i = 1$ ) n'est qu'une des nombreuses possibilités, comme par exemple une distribution des coefficients de pondération obtenue à partir d'études des "courbes de survie" des différents éléments du matériel.

2. Le stock net en fin de période est

$$= \sum_{i=1}^L W_i I_{it} d_i$$

où  $L$ ,  $W_i$  et  $I_{it}$  ont la même signification que précédemment, et

$$d_i = 1 - \frac{1}{L} T \quad (T = 0, 1, \dots, L - 1)$$

ce qui signifie que la valeur de l'actif diminue de façon linéaire. Là encore, cette hypothèse n'est qu'une des nombreuses possibilités. Au cours des dernières années, le système d'amortissement par le solde décroissant s'est de plus en plus répandu.

Il est à noter que les stocks ci-dessus se rapportent à la fin de chaque année civile, et qu'il est nécessaire d'apporter quelques ajustements mineurs pour le centrage des estimations sur le milieu de l'année.

Comme on l'a mentionné précédemment dans le cas de certaines industries, on dispose d'autres mesures lorsque d'autres hypothèses, comme par exemple celles d'une distribution en cloche des coefficients de pondération et de différentes fonctions d'amortissement, ont été utilisées. On espère faire paraître dans un proche avenir une publication distincte qui leur sera consacrée.

Le stock de capital domiciliaire inclut tous les logements non-collectifs, privés ou publics,

public, mobile homes and conventionally built structures. It includes the related items, non-movable equipment installed in residential buildings, outbuildings such as garages, swimming pools, sheds, etc. Expenditures for major alterations and improvements are also capitalized.

As in the case of non-residential capital stock series, the perpetual inventory method is utilized in deriving residential capital stock estimates. However, the value of discarded assets and the depreciation function employed are different. The value of discards or dwellings demolished is estimated using information derived from the Building Permit Survey and the annual report of the Fire Commissioner of Canada rather than a mortality pattern based on an average expected life of dwellings.

While the non-residential net capital stock estimate results from the application of a linear depreciation function, residential net capital stock is estimated using the declining balance pattern (exponential function) which assumes that annual depreciation changes equal a fixed percentage of the net value of the asset at the beginning of the year. The depreciation rate actually used is 2% a year for all types of dwellings. There is no general agreement as to the correct method of computing depreciation but geometric decay of productive capacity of residential stock is a commonly employed assumption in studies done in Canada and abroad.

#### Brief Explanation of Terms

**Constant valuation** measures values in constant prices (1971).

**Current valuation** measures values in the prices of the given year.

**Depreciation** (capital consumption allowance) is the allowance made for physical deterioration and obsolescence.

**Discards** (retirements) are the value of gross investment that is withdrawn from the stock.

**Gross fixed capital formation** (gross investment) is the value of new fixed capital goods purchased by the industries for which stock measurement is estimated. The data are obtained from Statistics Canada, *Private and Public Investment in Canada, Outlook*, Catalogue 61-205.

de type conventionnel ou mobile. Il comprend aussi tous les éléments auxiliaires, tel que l'équipement permanent à l'intérieur du logement ainsi que les constructions connexes telles que garages, piscines, remises, etc. Les dépenses pour les travaux de rénovation ou d'amélioration sont aussi incluses.

La technique d'estimation du stock de capital domiciliaire est essentiellement la même que celle utilisée pour l'estimation du stock non-domiciliaire à savoir celle de l'inventaire permanent. Cependant, elle diffère de cette dernière quant aux hypothèses retenues pour le calcul de la disparition et de la dépréciation des actifs. La valeur des logements démolis est calculée à partir de données fournies par l'enquête sur les permis de bâtir et le rapport annuel du commissaire des incendies du Canada, plutôt qu'une fonction de disparition basée sur la vie moyenne des logements.

Alors que la fonction de dépréciation utilisée lors de l'estimation du stock non-domiciliaire est de type linéaire, la fonction retenue pour le calcul du stock domiciliaire net est une fonction géométrique ou à solde décroissant. Celle-ci implique que le montant de dépréciation annuelle est un pourcentage fixe de la valeur nette de l'actif au début de l'année. Un taux de dépréciation de 2% est utilisé pour chacun des types de logement. Bien qu'il n'y ait pas de consensus sur la meilleure méthode de calcul de la dépréciation à employer, la décroissante géométrique de la capacité productive du stock de capital domiciliaire est l'une des hypothèses le plus couramment utilisée dans les travaux réalisés tant au Canada qu'à l'étranger.

#### Brève explication des termes utilisés

**Évaluation constante:** mesure les valeurs en dollars constants de 1971.

**Évaluation courante:** mesure les valeurs aux prix de l'année en cours.

**Dépréciation** (provision pour consommation de capital): prise en compte de la dégradation physique et de l'obsolescence.

**Retraits:** valeur des investissements bruts retirés du stock.

**Formation brute de capital fixe** (investissement brut): valeur des nouveaux biens d'immobilisation acquis par les industries dont on estime le stock. Les données sont obtenues à partir de *Investissements privés et publics au Canada, Perspectives*, Statistique Canada, n° 61-205 au catalogue.

The investment expenditures are grouped by types of capital assets. Construction includes building construction and all types of engineering construction such as roads, dams, transmission lines and pipelines, as well as oil drilling and mine development. The machinery and equipment category takes into account the purchase of all such items which are used either in producing goods or providing services but does not cover durable goods purchased for personal use. Included, as well as industrial machinery, are transportation equipment, agricultural implements, professional and scientific equipment, office and store furnishings and other similar capital goods. Excluded, for the purpose of this report, are outlays for machinery and equipment by the Department of National Defence.

The breakdown of construction into building and engineering construction for the two most recent years has been imputed on the basis of an average disaggregation, as compiled according to the Private and Public Investment Survey. The following industries were surveyed directly: mining, transport industries, (air, railway, water, motor and urban), electric power and federal, provincial and municipal governments.

**Gross stocks** are the cumulative value of gross investment in capital goods less cumulative discards.

**Mid-year gross and net stocks** are stocks adjusted to the middle of each year. Using the notations of Text Table I they are derived as follows:

$$\frac{K_n + K_{n-1}}{2} \text{ and } \frac{NK_n + NK_{n-1}}{2}$$

**Net stocks** are gross stocks less deductions of losses in value through physical deterioration and obsolescence.

**Service life** is the length of time during which capital assets are present in useful economic production before retirement occurs.

**Straight-line depreciation** for a capital asset is equal to its gross value divided by its service life.

Les dépenses d'investissement sont groupées par catégorie d'actifs de nature capitale. La construction comprend les bâtiments et tous les travaux de génie, comme les routes, les barrages, les lignes de transmission et les pipe-lines, ainsi que le forage de puits de pétrole et la mise en exploitation des mines. Dans le secteur des machines et de l'outillage, les achats comprennent tous les articles employés à la production de biens et de services mais non les biens durables achetés pour usage personnel. Sous cette rubrique sont inclus, en plus des machines industrielles, le matériel de transport, les instruments agricoles, le matériel professionnel et scientifique, les ameublements de bureaux et de magasins et autres biens capitaux du même genre. Toutefois, le présent rapport ne tient pas compte des montants consacrés à l'acquisition de machines et d'outillage par le Ministère de la Défense nationale.

La décomposition des données en bâtiment et travaux de génie pour les deux dernières années est dérivée à partir d'une moyenne des désaggrégations des données de l'enquête sur les investissements privés et publics au Canada. Les résultats pour les mines, le transport aérien, par chemin de fer, par eau, routier et urbain, l'énergie électrique et les gouvernements fédéral, provinciaux et municipaux sont basés sur une enquête directe.

**Stocks bruts:** valeur cumulative des investissements bruts en capital moins les retraits cumulatifs.

**Stocks bruts et nets du milieu de l'année:** stocks ajustés sur le milieu de chaque année. En utilisant les symboles du tableau explicatif I, on les calcule suivant les formules:

$$\frac{K_n + K_{n-1}}{2} \text{ et } \frac{NK_n + NK_{n-1}}{2}$$

**Stocks nets:** stocks bruts moins pertes de valeur en raison de la dégradation physique et de l'obsolescence.

**Durée de vie:** durée de la présence des actifs de nature capitale dans la production économique utile avant retrait.

**Amortissement linéaire:** dans le cas d'un actif de nature capitale, il est égale à la valeur brute de cet actif divisée par sa durée de vie.

TEXT TABLE I. Example: Assumed Service Life = 10 Years = L

1. The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

2. The price index is the implicit price index of residential construction.

L'indice de prix est l'indice implicite de prix de la construction domiciliaire.

## Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

## How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

National Wealth and Capital Stock Section,  
Science, Technology and Capital Stock Division,

Statistics Canada, Ottawa, K1A 0T6 (Telephone: 990-9684) or to the Statistics Canada reference centre in:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (990-8116)	Edmonton (420-3027)
Toronto (973-6586)	Vancouver (666-3691)
Credit card only (973-8018)	

Toll-free access is provided in all provinces and territories, **for users who reside outside the local dialing area** of any of the regional reference centres.

## Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordiolingue et le système d'extraction de Statistique Canada.

## Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section de la richesse nationale et des stocks de capital,  
Division des sciences, de la technologie et du stock de capital,

Statistique Canada, Ottawa, K1A 0T6 (téléphone: 990-9684) ou au centre de consultation de Statistique Canada à:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (990-8116)	Edmonton (420-3027)
Toronto (973-6586)	Vancouver (666-3691)
Carte de crédit seulement (973-8018)	

Un service d'appel interurbain sans frais est offert, dans toutes les provinces et dans les territoires, **aux utilisateurs qui habitent à l'extérieur des zones de communication locale** des centres régionaux de consultation.

## SYMBOLS

The following standard symbols are used in Statistics Canada publications:

- .. figures not available.
- ... figures not appropriate or not applicable.
- nil or zero.
- amount too small to be expressed.
- P preliminary figures.
- r revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.

## NOTE ON CANSIM

CANSIM (Canadian Socio-Economic Information Management System) is Statistics Canada's computerized data bank and its supporting software. Most of the data appearing in this publication, as well as historical data are available from CANSIM via terminal, on computer printouts, or in machine readable form. Matrix numbers are given in Text Table III.

For further information write to CANSIM Division, Statistics Canada, Ottawa, K1A 0T6 or telephone (613) 990-8200.

## SIGNES CONVENTIONNELS

Les signes conventionnels suivants sont employés uniformément dans les publications de Statistique Canada:

- .. nombres indisponibles.
- ... n'ayant pas lieu de figurer.
- néant ou zéro.
- nombres infimes.
- P nombres provisoires.
- r nombres rectifiés.
- x confidentiel en vertu des dispositions de la Loi sur la statistique relatives au secret.

## NOTE CONCERNANT CANSIM

Le CANSIM (Système canadien d'information socio-économique) est le système de Statistique Canada qui se compose d'une banque de données informatisées et de son logiciel de soutien. La plupart des données présentées dans cette publication ainsi que des données historiques peuvent être extraites du CANSIM par l'intermédiaire d'un terminal, sous forme d'imprimées d'ordinateur ou sous forme lisible par machine. Les numéros de matrice apparaissent au tableau explicatif III.

Pour plus de renseignements écrivez à la Division CANSIM Statistique Canada, Ottawa, K1A 0T6 ou téléphonez à (613) 990-8200.

## INTRODUCTION

The procedures and problems associated with the estimates of capital stocks are fully described in Catalogue 13-522. The purpose of this introduction is to present a brief outline of the basic methodology underlying the capital flow and stock data presented in this report.

Capital stocks in existence are traditionally considered one among several factors of production. The measurement of capital in both theoretical and technical formulations is closely related to investment to the extent that a certain technical link between the two concepts and definitions (stocks, flows) has to be established before any elaboration can be made in the direction of capital measurement.

Traditionally, the relationship between the capital stock and the corresponding flow of capital services is one of proportionality. This assumption implies that the services of capital goods acquired at different points in time are perfect substitutes in production. From this substitutability over time stems the property of proportionality between the capital services from each capital good and the stock of capital as measured by adding together all past investment acquisitions.

There is a substantial literature, both theoretical and technical, relating to the measurement of capital. Among a number of methods the "Perpetual Inventory" method is generally preferred primarily because of its malleability in the creation of time series of capital stocks.

Briefly, this method involves the accumulation over a period of years of investment expenditures by industry to obtain its capital stock in any given year.

The basic ingredients required are:

- annual investment series, broken down by industry and category of expenditure,
- price deflators relating to the investment series,
- estimates of average economic lives of the assets used in the various industries.

Les méthodes et problèmes associés aux estimations des stocks de capital sont décrits au complet dans le n° 13-522 au catalogue. La présente introduction vise à décrire brièvement la méthodologie à la base des données sur les stocks et flux de capital présentées dans cette publication.

Les stocks de capital existants ont toujours été considérés comme l'un des facteurs de production. La mesure du capital tant du point de vue théorique que pratique est étroitement liée aux investissements, dans la mesure où il faut établir un certain lien technique entre les deux concepts et définitions (stocks, flux) avant de pouvoir progresser dans la mesure du capital.

La relation entre le stock de capital et le flux correspondant de services de nature capitale a toujours été une relation de proportionnalité. Ce postulat implique que les services des biens de capital acquis à différents moments sont des substituts parfaits dans la production. De cette notion de possibilité de substitution dans le temps découle celle de proportionnalité entre les services de nature capitale provenant de chaque bien de capital et le stock de capital, mesuré par la somme de toutes les acquisitions faites grâce aux investissements.

Un nombre appréciable d'auteurs se sont penchés sur la mesure du capital à la fois du point de vue théorique et du point de vue pratique. Parmi les diverses méthodes existantes, on préfère généralement celle de "L'inventaire perpétuel" avant tout pour sa souplesse lors de la création de séries chronologiques de stocks de capital.

En bref, il s'agit d'accumuler pendant un certain nombre d'années les dépenses d'investissements de l'industrie pour obtenir son stock de capital pour une année donnée.

Les éléments fondamentaux nécessaires sont:

- les séries annuelles des investissements, par industrie et catégorie de dépense,
- les indices de déflation se rapportant aux séries sur les investissements,
- les estimations de la durée de vie économique moyenne des actifs utilisés par les diverses industries.

The reliability of the capital stocks series thus generated depends of course on the quality, of the investment data being cumulated, and on the realism of both the service life assumption and the method by which capital assets are considered to depreciate over their service life.

As an aid to a better understanding of the mechanics of the "Perpetual Inventory" method, an illustration of the actual computing process is given. Assume that the capital assets in a particular industry remain in production 10 years before they are retired.

Investment expenditures pertaining to the types of capital assets in question, adjusted for prices, are cumulated for a period of 10 years. In the tenth year a measure of the gross stock of this industry's capital assets is obtained. In the eleventh year the investment expenditures of the first year are deducted from the cumulated total while the purchases of capital assets of the new year are added. We proceed in the same manner for all subsequent years.

In the **gross capital stocks**, capital assets are included at their full value during the entire time they remain in the capital stock. In other words, the deductions from gross investment are due to the fact that assets in question have ceased to exist. An alternative set of measures of capital stocks is derived by adjusting the value of the assets in existence for the wear and tear and obsolescence they undergo during their service life; these estimates are known as **net capital stocks**. Calculations of net capital stocks are made by applying a depreciation formula to the gross stock estimates. The **net stocks** presented in this report have been prepared by means of using the "straight-line" method. The net stock is always equal to the difference between the cumulative value of past gross investment and cumulative depreciation. Text Table I summarizes an exemplary illustration of the computational procedure involved in the "Perpetual Inventory" method. Text Table II shows the industries for which capital flow and stock estimates are presented in this volume together with the types of assets and their service lives.

In the context of the "Perpetual Inventory" method, the value of the capital stock can also be viewed as the weighted sum of past gross investment expenditures. The weights used can be thought of as the resultant of two factors. The first factor relates to the mortality of an asset, namely the probability that the assets of a certain age are in existence when the stock is being estimated. In other words this factor relates to the depreciation in the sense of physical decay, retirement, etc.

La fiabilité des séries de stock de capital ainsi produites dépend naturellement de la qualité des données sur les investissements qui ont été réunies, du réalisme à la fois de l'hypothèse de durée de vie et de la méthode que l'on a retenue pour la dépréciation des actifs de nature capitale tout au long de leur vie utile.

Afin de mieux faire saisir le mécanisme de la méthode de "L'inventaire perpétuel", le lecteur trouvera ci-après une illustration du processus réel de calcul. Supposons que les actifs de nature capitale d'une industrie donnée demeurent en production 10 ans avant d'être retirés.

Les dépenses d'investissement se rapportant aux catégories d'actifs de capital considérées, après déflation, sont sommées sur une période de 10 ans. La dixième année, on obtient une mesure du stock brut des actifs de capital de cette industrie. La onzième année, on déduit les dépenses d'investissement de la première année du total cumulé, et on ajoute les achats de nature capitale au cours de la nouvelle année. On procède ainsi de la même manière pour toutes les années suivantes.

On regroupe dans les **stocks bruts de capital** les actifs de nature capital à leur valeur intégrale tant que ces actifs font partie du stock de capital. En d'autres termes, les déductions sur les investissements bruts s'expliquent par le fait que les actifs en question ont cessé d'exister. On obtient un autre ensemble de mesures des stocks de capital en ajustant la valeur des actifs existants pour prendre en compte l'usure et l'obsolescence qu'ils subissent lors de leur durée de vie, et l'on appelle ces estimations **stocks nets de capital**. On calcule les stocks nets de capital grâce à une formule d'amortissement que l'on fait intervenir dans les estimations des stocks bruts. Les **stocks nets** indiqués dans la présente publication ont été calculés grâce à la méthode dite "linéaire". Le stock net est toujours égal à la différence entre la valeur cumulative des investissements bruts antérieurs et la dépréciation accumulée. On trouvera au tableau explicatif I un exemple récapitulatif de la méthode de calcul utilisée dans la méthode de "L'inventaire perpétuel". Le tableau explicatif II présente les industries dont les estimations des flux et stocks de capital figurent dans le présent ouvrage, ainsi que les différentes catégories d'actifs et leurs durées de vie.

Dans le cadre de la méthode de "L'inventaire perpétuel", on peut aussi considérer la valeur du stock de capital comme la somme pondérée des dépenses d'investissement brutes antérieures. Les coefficients de pondération utilisés peuvent être considérés comme le résultat de deux facteurs. Le premier de ces facteurs se rapporte à la disparition d'un actif, c'est-à-dire à la probabilité que les actifs d'un certain âge existent encore lors de l'estimation du stock. En d'autres termes, ce facteur se rapporte à la dépréciation, dans le sens de dégradation physique, de retrait, etc.

The second factor deals with the value of the assets still present in the stock. If the items included in the stock retain their original value then we are measuring the gross stock; if their value is diminishing over their service life then we are measuring the net stocks where allowances have been made for wear and tear and obsolescence.

We can summarize the nature of the calculations involved in measuring the stock of capital in the following fashion:

1. Gross stock at the end of period =

$$\sum_{i=1}^L W_i I_{it}$$

where  $L$  = the assumed economic life of the capital asset,  $W_i = 1$  during the lifetime of the asset and  $I_{it}$  = the investment expenditures during each period. This assumption about the weight ( $W_i = 1$ ) is only one among many possibilities such as a distribution of weights derived from studies of the "survival curves" of individual pieces of equipment.

2. Net stock at the end of the period

$$= \sum_{i=1}^L W_i I_{it} d_i$$

where  $L$ ,  $W_i$  and  $I_{it}$  are defined as before and

$$d_i = 1 - \frac{1}{L} T \quad (T = 0, 1, \dots, L - 1)$$

which indicates that the value of the asset declines linearly. Again, this assumption is one among many alternatives. In recent years the diminishing balance system of depreciation has become increasingly popular.

It should be noted that the above stocks relate to the end of each calendar year and some minor adjustments are necessary to centre the estimates to the middle of each calendar year.

As mentioned before, for certain industries alternative measures are available where alternative assumptions such as bell-shaped distribution of weights and different depreciation functions have been used. It is hoped that in the near future a separate publication dealing with these alternative measures will become available.

Residential capital stock includes all non-collective dwellings, private and

Le second facteur a trait à la valeur des actifs faisant encore partie du stock. Si les éléments du stock conservent leur valeur originale, nous mesurons alors le stock brut; si leur valeur diminue tout au long de leur durée de vie, nous mesurons alors les stocks nets, après avoir pris en compte l'usure et l'obsolescence.

Nous pouvons résumer ainsi la nature des calculs entraînés par la mesure du stock de capital:

1. Le stock brut en fin de période est =

$$\sum_{i=1}^L W_i I_{it}$$

où  $L$  est la durée de vie présumée de l'actif, et  $I_{it}$  sont les dépenses d'investissement au cours de chaque période. L'hypothèse relative au coefficient de pondération ( $W_i = 1$ ) n'est qu'une des nombreuses possibilités, comme par exemple une distribution des coefficients de pondération obtenue à partir d'études des "courbes de survie" des différents éléments du matériel.

2. Le stock net en fin de période est

$$= \sum_{i=1}^L W_i I_{it} d_i$$

où  $L$ ,  $W_i$  et  $I_{it}$  ont la même signification que précédemment, et

$$d_i = 1 - \frac{1}{L} T \quad (T = 0, 1, \dots, L - 1)$$

ce qui signifie que la valeur de l'actif diminue de façon linéaire. Là encore, cette hypothèse n'est qu'une des nombreuses possibilités. Au cours des dernières années, le système d'amortissement par le solde décroissant s'est de plus en plus répandu.

Il est à noter que les stocks ci-dessus se rapportent à la fin de chaque année civile, et qu'il est nécessaire d'apporter quelques ajustements mineurs pour le centrage des estimations sur le milieu de l'année.

Comme on l'a mentionné précédemment dans le cas de certaines industries, on dispose d'autres mesures lorsque d'autres hypothèses, comme par exemple celles d'une distribution en cloche des coefficients de pondération et de différentes fonctions d'amortissement, ont été utilisées. On espère faire paraître dans un proche avenir une publication distincte qui leur sera consacrée.

Le stock de capital domiciliaire inclut tous les logements non-collectifs, privés ou publics,

public, mobile homes and conventionally built structures. It includes the related items, non-movable equipment installed in residential buildings, outbuildings such as garages, swimming pools, sheds, etc. Expenditures for major alterations and improvements are also capitalized.

As in the case of non-residential capital stock series, the perpetual inventory method is utilized in deriving residential capital stock estimates. However, the value of discarded assets and the depreciation function employed are different. The value of discards or dwellings demolished is estimated using information derived from the Building Permit Survey and the annual report of the Fire Commissioner of Canada rather than a mortality pattern based on an average expected life of dwellings.

While the non-residential net capital stock estimate results from the application of a linear depreciation function, residential net capital stock is estimated using the declining balance pattern (exponential function) which assumes that annual depreciation changes equal a fixed percentage of the net value of the asset at the beginning of the year. The depreciation rate actually used is 2% a year for all types of dwellings. There is no general agreement as to the correct method of computing depreciation but geometric decay of productive capacity of residential stock is a commonly employed assumption in studies done in Canada and abroad.

#### Brief Explanation of Terms

**Constant valuation** measures values in constant prices (1971).

**Current valuation** measures values in the prices of the given year.

**Depreciation** (capital consumption allowance) is the allowance made for physical deterioration and obsolescence.

**Discards** (retirements) are the value of gross investment that is withdrawn from the stock.

**Gross fixed capital formation** (gross investment) is the value of new fixed capital goods purchased by the industries for which stock measurement is estimated. The data are obtained from Statistics Canada, **Private and Public Investment in Canada, Outlook**, Catalogue 61-205.

de type conventionnel ou mobile. Il comprend aussi tous les éléments auxiliaires, tel que l'équipement permanent à l'intérieur du logement ainsi que les constructions connexes telles que garages, piscines, remises, etc. Les dépenses pour les travaux de rénovation ou d'amélioration sont aussi incluses.

La technique d'estimation du stock de capital domiciliaire est essentiellement la même que celle utilisée pour l'estimation du stock non-domiciliaire à savoir celle de l'inventaire permanent. Cependant, elle diffère de cette dernière quant aux hypothèses retenues pour le calcul de la disparition et de la dépréciation des actifs. La valeur des logements démolis est calculée à partir de données fournies par l'enquête sur les permis de bâtir et le rapport annuel du commissaire des incendies du Canada, plutôt qu'une fonction de disparition basée sur la vie moyenne des logements.

Alors que la fonction de dépréciation utilisée lors de l'estimation du stock non-domiciliaire est de type linéaire, la fonction retenue pour le calcul du stock domiciliaire net est une fonction géométrique ou à solde décroissant. Celle-ci implique que le montant de dépréciation annuelle est un pourcentage fixe de la valeur nette de l'actif au début de l'année. Un taux de dépréciation de 2% est utilisé pour chacun des types de logement. Bien qu'il n'y ait pas de consensus sur la meilleure méthode de calcul de la dépréciation à employer, la décroissante géométrique de la capacité productive du stock de capital domiciliaire est l'une des hypothèses le plus couramment utilisée dans les travaux réalisés tant au Canada qu'à l'étranger.

#### Brève explication des termes utilisés

**Évaluation constante:** mesure les valeurs en dollars constants de 1971.

**Évaluation courante:** mesure les valeurs aux prix de l'année en cours.

**Dépréciation** (provision pour consommation de capital): prise en compte de la dégradation physique et de l'obsolescence.

**Retraits:** valeur des investissements bruts retirés du stock.

**Formation brute de capital fixe** (investissement brut): valeur des nouveaux biens d'immobilisation acquis par les industries dont on estime le stock. Les données sont obtenues à partir de **Investissements privés et publics au Canada, Perspectives**, Statistique Canada, n° 61-205 au catalogue.

The investment expenditures are grouped by types of capital assets. Construction includes building construction and all types of engineering construction such as roads, dams, transmission lines and pipelines, as well as oil drilling and mine development. The machinery and equipment category takes into account the purchase of all such items which are used either in producing goods or providing services but does not cover durable goods purchased for personal use. Included, as well as industrial machinery, are transportation equipment, agricultural implements, professional and scientific equipment, office and store furnishings and other similar capital goods. Excluded, for the purpose of this report, are outlays for machinery and equipment by the Department of National Defence.

The breakdown of construction into building and engineering construction for the two most recent years has been imputed on the basis of an average disaggregation, as compiled according to the Private and Public Investment Survey. The following industries were surveyed directly: mining, transport industries, (air, railway, water, motor and urban), electric power and federal, provincial and municipal governments.

**Gross stocks** are the cumulative value of gross investment in capital goods less cumulative discards.

**Mid-year gross and net stocks** are stocks adjusted to the middle of each year. Using the notations of Text Table I they are derived as follows:

$$\frac{K_n + K_{n-1}}{2} \text{ and } \frac{NK_n + NK_{n-1}}{2}$$

**Net stocks** are gross stocks less deductions of losses in value through physical deterioration and obsolescence.

**Service life** is the length of time during which capital assets are present in useful economic production before retirement occurs.

**Straight-line depreciation** for a capital asset is equal to its gross value divided by its service life.

Les dépenses d'investissement sont groupées par catégorie d'actifs de nature capitale. La construction comprend les bâtiments et tous les travaux de génie, comme les routes, les barrages, les lignes de transmission et les pipe-lines, ainsi que le forage de puits de pétrole et la mise en exploitation des mines. Dans le secteur des machines et de l'outillage, les achats comprennent tous les articles employés à la production de biens et de services mais non les biens durables achetés pour usage personnel. Sous cette rubrique sont inclus, en plus des machines industrielles, le matériel de transport, les instruments agricoles, le matériel professionnel et scientifique, les ameublements de bureaux et de magasins et autres biens capitaux du même genre. Toutefois, le présent rapport ne tient pas compte des montants consacrés à l'acquisition de machines et d'outillage par le Ministère de la Défense nationale.

La décomposition des données en bâtiment et travaux de génie pour les deux dernières années est dérivée à partir d'une moyenne des désagré-gations des données de l'enquête sur les investissements privés et publics au Canada. Les résultats pour les mines, le transport aérien, par chemin de fer, par eau, routier et urbain, l'énergie électrique et les gouvernements fédéral, provinciaux et municipaux sont basés sur une enquête directe.

**Stocks bruts:** valeur cumulative des investissements bruts en capital moins les retraits cumulatifs.

**Stocks bruts et nets du milieu de l'année:** stocks ajustés sur le milieu de chaque année. En utilisant les symboles du tableau explicatif I, on les calcule suivant les formules:

$$\frac{K_n + K_{n-1}}{2} \text{ et } \frac{NK_n + NK_{n-1}}{2}$$

**Stocks nets:** stocks bruts moins pertes de valeur en raison de la dégradation physique et de l'obsolescence.

**Durée de vie:** durée de la présence des actifs de nature capitale dans la production économique utile avant retrait.

**Amortissement linéaire:** dans le cas d'un actif de nature capitale, il est égale à la valeur brute de cet actif divisée par sa durée de vie.

1. The estimates for the two most recent years are based respectively on preliminary and expected investment expenditures.

Les données relatives aux deux dernières années sont dérivées à partir de dépenses provisoires et projetées.

2. The price index is the implicit price index of residential construction.

L'indice de prix est l'indice implicite de prix de la construction domiciliaire.

## LIST OF RELATED PUBLICATIONS

### Catalogue
